

## Modernising school management practices with Findex AI solutions

Findex partnered with The Cathedral School of St Anne and St James to help them streamline their processes as well as boost the accuracy and efficiency of their financial operations. This was achieved using the Findex Data Science Portal – an AI based solution designed to help make education management practices more intuitive.

### About The Cathedral School

The Cathedral School of St Anne and St James is an independent Anglican co-educational school in Townsville suburb Mundingburra. With more than 1200 students across Early Learning to Year 12, the school provides a caring Christian environment with a strong focus on academic performance and personal development.

With the school employing over 300 staff, they focus on best practice and working as a team to provide the best learning experience to all students.

With this high engagement and attention expectations, the leadership team thrive to ensure administration efficiency and data analytical solutions to drive strategy.

**“Extending across curriculum, student enrolments, finance and reporting functions to the school board, this custom designed program has completely transformed the way we monitor administrative tasks. Overall, the Findex data science tool has been a game changer for our independent school.”**

Sonya Chun Tie,  
Business Manager – The Cathedral School

## Approach

For The Cathedral School, the management and analysis of school data was extremely time consuming and tended to require more technical expertise. While there are a few school management solutions available in the market, most lack the analytical capabilities required to truly streamline operations.

Recognising this, the Findex Data Science team had already developed an automated portal which manages and integrates school-related data. By tapping into the functionality of this portal, Findex was able to offer The Cathedral School a centralised system through an API that provides real-time data visualisations, benchmarking and forecasting.

## Achievements

Sonya explains, “the API has streamlined our processes and made our decision making and financial management more efficient and accurate. With near real-time data integration, we can easily track our expenses and revenues, monitor budgets, and generate detailed financial reports.”

The Cathedral School of St Anne and St James can now extract real value out of their historical data, while adopting an analytical approach that enables more informed decision-making.

**“The Findex Data Science Portal has been a game changer for our independent school. It has helped us optimise our financial operations, reduce administrative workload, and improve our financial decision-making. I highly recommend this solution to any school looking to modernise their financial management practices”**
