

## **Environmental Risk Assessment Summary**

### **Atezolizumab**

#### **Introduction**

The publication of environmental risk assessment summaries is part of Roche's engagement on developing a better understanding of issues regarding pharmaceuticals in the environment (PiE).

New pharmaceutical substances are investigated for biodegradability and initial ecotoxicity during their development. For registration, a full state-of-the-art environmental risk assessment is developed based on chronic environmental effects and advanced environmental fate data, as required by the pertinent regulations. While not a regulatory requirement, Roche also investigates older pharmaceutical substances, normally at a simpler scale, in order to assess their environmental risks.

The EMA Guideline on Environmental Risk Assessment (ERA) for Non-GMO Human Medicinal Products [1] requires an ERA for the Marketing Authorisation Application (MAA) of all new medicinal products in the European Union. For proteins and peptides, however, the 'ERA may consist of a justification for not submitting ERA studies, e.g., due to their nature they are unlikely to result in a significant risk to the environment'.

#### **Summary**

Atezolizumab is an IgG1 monoclonal antibody produced by recombinant DNA technology which is indicated (a) for the treatment of adult patients with locally advanced or metastatic urothelial carcinoma after prior chemotherapy or who are considered cisplatin-ineligible and indicated (b) for the treatment of adult patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) after prior chemotherapy [2].

Atezolizumab is the active pharmaceutical ingredient used in the Roche product Tecentriq [3].

Ecotoxicity and biodegradability tests with Atezolizumab were not performed. However, acute ecotoxicity limit tests with green algae, daphnids and fish with other monoclonal antibodies consistently showed no adverse effects at the only tested concentration of 100 mg/L nominal concentration relating to the active substances. Also biodegradability tests with other monoclonal antibodies showed ready biodegradability [4].

Considering human metabolism and the suggested rapid biodegradability and the suggested low acute ecotoxicological properties of Atezolizumab, no exposure levels of concern to the environment are to be expected. This confirms the general finding that monoclonal antibodies and other protein or peptide active pharmaceutical substances are not expected to pose any risk to the environment [4].
