Optimize Crew Scheduling

Crew Management

Tracsis' Crew Calling tool was designed to provide the ability for control staff to search for all resources currently allocated to a train to allow better assessment, knowledge and forward planning when considering options for on-the-day changes to either staff or rolling stock allocated work.

At a glance Control staff can:

- Import, modify and reallocate schedules
- Undertake rules checks against daily schedules
- Assign skill sets to staff and validate against requirements for tasks
- View staff allocations, where they are now and next along with their shift pattern for the day
- Identify un-allocated trains, standby staff, RDO staff (Rostered day off), shift plans and resourcing conflicts.
- During periods of disruption or staff absence resources can be quickly re-allocated.

Team Engagement

Staff can access the Crew Calling system via its web front-end. This enables them to;

- View upcoming schedules
- Accept/decline shifts
- Update availability at short notice

Technical Overview

- **Innovation** – Removing manual allocation and validation of crew shifts ensures scheduling is faster and more reliable
- **Hosting** – Both on-premise and cloud hosted options are available
- **Integration** – API connectivity to existing HR, rolling stock management and timetabling tools
