AF-Color®

Technically sophisticated colour masterbatches
based on polyketone

Polyketone-based masterbatches for maintaining polymer properties

Polyketone (PK) is an engineering thermoplastic polymer and has outstanding characteristic properties. Its better environmental compatibility compared to polymer types such as PA, PBT or POM rounds off the properties of this versatile material. PK compounds can be used unreinforced, glass fibre reinforced or carbon fibre reinforced.

All masterbatches in our PK series can be customised to your selected polymer grade. Colouring with a polyketone-based masterbatch retains the aforementioned positive properties of the polymer.

Polyketone can be used in a wide range of industries and is also suitable for drinking water, food contact and toys.

Our AF-Color® PK masterbatches are available in accordance with standards and are approved at least in accordance with the regulatory guidelines of Regulation EU 10/2011. Certificates of conformity are available on request.

AF-Color® PK masterbatches already developed

Please note that the original colour may differ from the printed version or the screen resolution! The colour result may also vary depending on the combined reinforced or unreinforced polymer. Our colouring was carried out in an unreinforced polyketone. We would be happy to test our colour formulation in your desired material.
