

Service Bulletin

no. 10, 2006-02-13

General maintenance

System applicability: Marinfloc CD units

Important!

According to Marinfloc Operator's Manual for CD models under "Maintenance", it is described how to perform a steam regeneration of the filter material by increasing the temperature on the backflush water heater to 99 °C. As it is possible to "push" out filter material from the filter step, down to the bilge water tank if the temperature rises to 100 °C, it is very important that the temperature of the regeneration water never exceeds 90 °C.

All previous service bulletins and other important information, e.g. updated lists of approved chemicals and flocculants, can be found on our website www.marinfloc.com
