PRESS RELEASE

Beta Systems presents new generation of Linux- and Unix-based solutions for output and log management

Berlin, July 7, 2021 - Beta Systems presents the new generation V5 of its Linux- and Unix-based solutions for output management and document archiving as well as log management and archiving. With the new product generation, customers receive improved functionalities coupled with more flexibility and enhanced security and compliance capabilities.

_beta doc|x, the successor product for Beta UX DistributionMaster and ContentMaster, is a comprehensive software solution for the management, storage and provision of extensive document data, regardless of source, format and scope. Sources from special application systems such as SAP can be used and integrated as well as the long-established mainframe document formats. Documents can be archived centrally and audit-proof with _beta doc|x and made available online at low cost. Data from many different document sources can be flexibly prepared and made available for mass printing.

_beta log|x, the successor product for Beta UX LogMaster, is a solution for cross-platform and cross-format log data management in companies. Data from different sources, e.g. mainframe, Windows, Linux/ Unix systems and applications (e.g. SAP) can be consolidated in one place and made available company-wide from there. All system activities can be analyzed and archived centrally. In this way, transparent and audit-proof data storage is possible over long periods of time. The new Beta UX data model offers improved job log output support for both IBM Z and distributed system usage.

"With the new generation, we also offer companies that use Linux or Unix as a strategic platform extremely powerful output and log management solutions for processing mass data," comments Dr. Andreas Huth, Member of the Board of Beta Systems.
