

FACTSHEET

HyCare | Broiler farms

JUNE 2024

What is HyCare?

With the HyCare-method, The Schippers Group supports livestock companies across the world to improve hygiene on their farm. Livestock companies who apply the HyCare method are improving the health of their animals and see their technical results increase.

HyCare on Poultry Farms

The HyCare method can be implemented on broiler, layer, and (rearing) breeder farms. Besides using the right products, proper guidance is crucial. This ensures the correct application methods, monitoring, coaching, and on-site service. The comprehensive approach provides the greatest improvement both technically and financially.

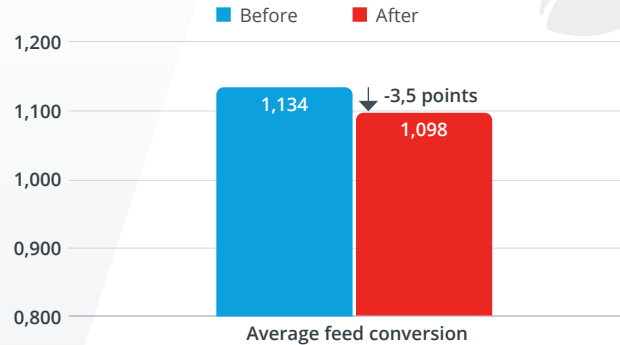

Current Results

The graphs below represent a collection of multiple broiler farms that have been working with HyCare over several cycles. The graphs are divided into farms with regular broilers and those with 1-star BLK (slow-growing) broilers. Averages from all cycles and all farms have been used. Therefore, some farms perform higher and others lower. The greatest improvements are observed in feed conversion and weights (growth).

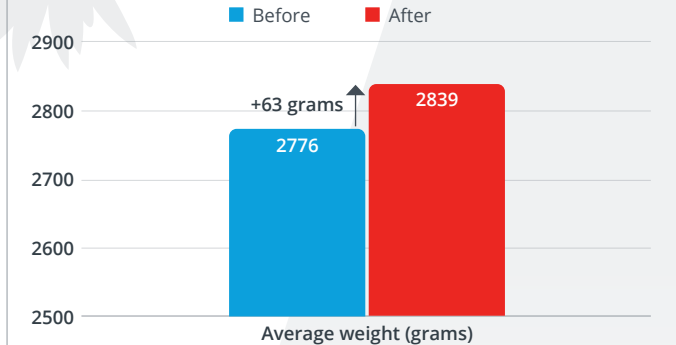

The **Schippers** Group

Let's beat AMR with HyCare

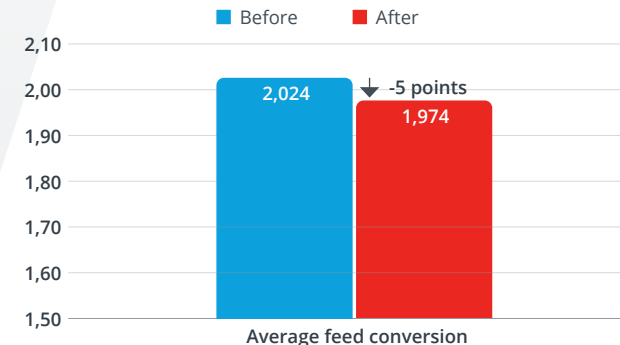

Regular broilers: average feed conversion

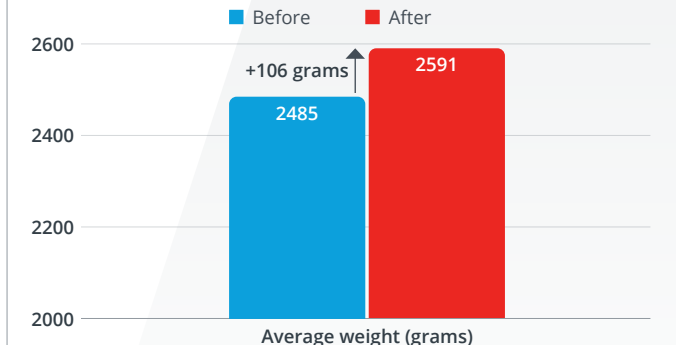

Regular broilers: average weight

1-star BLK broilers: average feed conversion

1-star BLK broilers: average weight

For comparison with regular broilers:

- With a feed price of 40 euros/100 kg, a reduction of 1 point in feed conversion saves approximately 0.98 cents per chick.*
- With a selling price of 1.15 euros/100 kg, an increase of 10 grams in final weight saves 1.15 cents per chick.

For comparison with 1-star BLK broilers:

- With a feed price of 40 euros/100 kg, a reduction of 1 point in feed conversion saves approximately 1.04 cents per chick.**
- With a selling price of 1.70 euros/100 kg, an increase of 10 grams in final weight saves 1.70 cents per chick.

* Calculated with an average weight of 2450 grams

** Calculated with an average weight of 2600 grams
