Designer Stairs & Glass Railings for Sophisticated Architecture

Stairs as a SCULPTURAL ELEMENT

For over 25 years, we have been designing and building custom staircases and railings. Our goal is to integrate design and feasibility early on.

That's why we don't wait until the building shell is complete to start thinking about staircases; instead, we support you starting in Service Phase 1 with comprehensive services:

Consulting on, among other things, design feasibility, cost estimates, and the early elimination of cost drivers

Preliminary planning, e.g., providing BIM data

3D planning support with detailed renderings at a scale of 1:5 — through to complete construction drawings

Preliminary Structural Design

Provision of tender documents in GAEB formats

Support with the implementationof assembly times, determining the most cost-effective time to implement

The earlier expert knowledge is incorporated into the planning process, the greater the chances of arriving at cost-effective, technically sound, and aesthetically compelling solutions.

The METALLART Service Package

Design and DETAIL

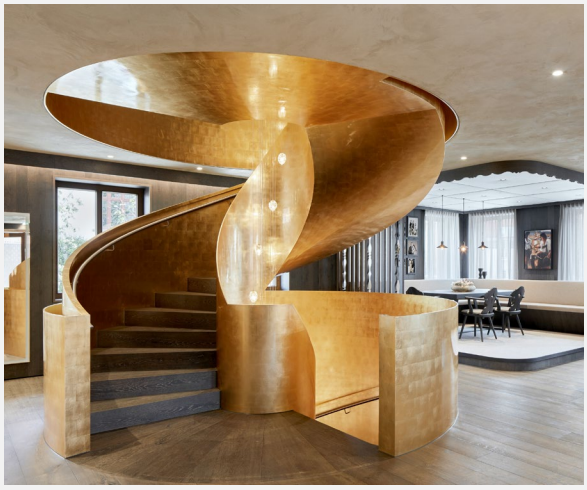

Our focus is on cantilevered, curved staircases. With precisely crafted details such as steel soffit cladding and all-glass railings, we create staircases that become sculptures in the space.

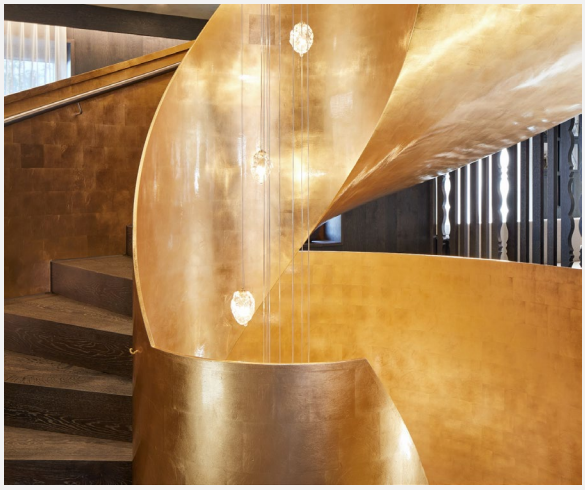

One-Stop Implementation: DESIGN, MANUFACTURING, INSTALLATION

From building permits to 3D design, manufacturing, and installation, all the way through to final inspection, we bring all services together under one roof. This reduces coordination points, increases schedule and cost certainty, and minimizes risks throughout the project.

Planning with TECHNICAL DEPTH

From the very beginning, we take into account technical constraints, adjacent trades, geological conditions, and impact sound insulation to ensure that we deliver customized solutions that comply with standards, in close coordination with structural engineering and the structural shell.
