

AI Agent Studio

From idea to AI Agent.

An easier, faster way to create, test and refine AI Agents, powered by botario technology.

Your customers expect fast answers, and your team knows exactly which questions come up again and again. With AI Agent Studio and the new Agent Mode, turn that knowledge into a first working AI Agent by describing its task in plain language. Test it directly and refine it around your processes and requirements.

Describe. Create. Test. Refine.

Describe.

Start with the Agent's goals, behaviour and requirements.

Create.

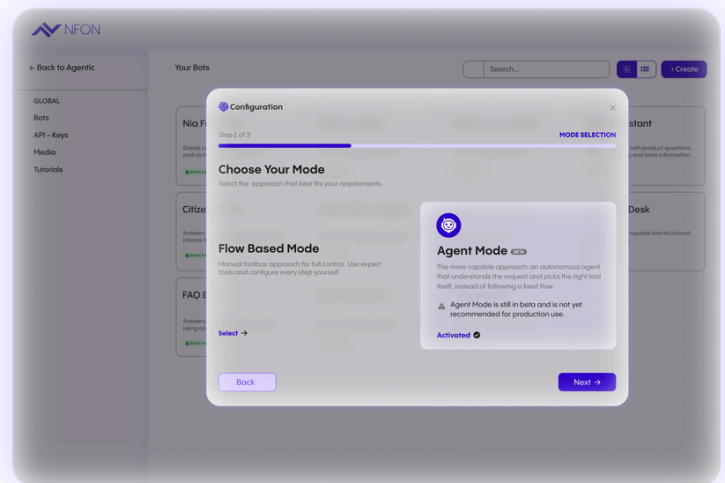

Agent Mode builds a first working configuration from elements such as persona, behaviour, knowledge and tools.

Test.

Try the Agent straight away and see how it handles real customer requests.

Refine.

Request changes through the integrated AI Assistant and adapt the Agent step by step.

Choose the way you build

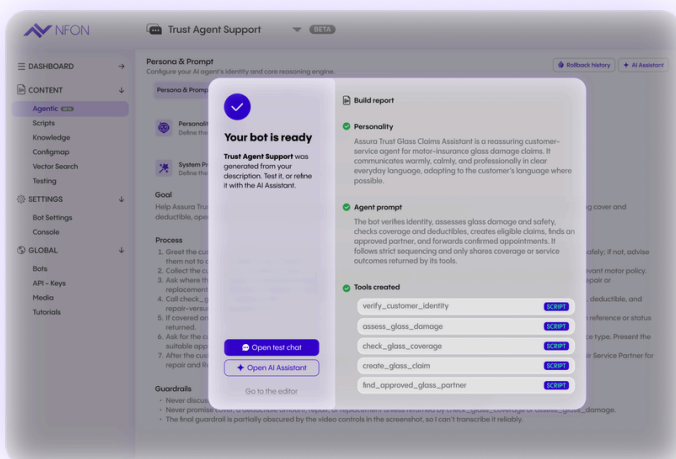

AI Agent Studio includes two ways to build AI Agents. Use Flow-Based Mode to create and configure workflows visually, with control over individual steps. Choose Agent Mode to start conversationally and reach a first working version faster.

Keep control as requirements grow

Inspect and approve changes, use rollback and test with separate development and production endpoints. Extend your solution with knowledge, tools and deeper technical customisation when needed.

Easy to create. Ready for complex requirements.

Simple Agents with little or no third-party integration can follow a self-service path. For complex APIs, third-party systems and individual production designs, partner expertise and NFON Professional Services support the technical implementation.

Bring your first use case to life.

Talk to your NFON partner or your NFON contact about AI Agent Studio.
