

Imagine your machines could talk

HF Xplore® – Condition monitoring

Unplanned downtime rarely comes without warning – it's just that no one notices in time. **HF Xplore®** makes the condition of your machines visible, catching small anomalies before they turn into costly failures. Beyond your existing sensor data, **HF Xplore®** adds context: fast, standardised overview that make comparisons across machines easy – added with machine intelligence.

HF Xplore® is available flexibly: as an Edge solution directly on the machine, with full data sovereignty on-site, or as a Cloud variant offering easy comparability across machines, more historical insights and the full feature set. Both are built on the same intelligence – you decide on the reach.

Your benefits

- **Context beyond the HMI** – Turns isolated values and alarms into a meaningful picture over time and across machines
- **Direction before damage** – Health Status gives an immediate signal on which component needs attention – no interpretation needed
- **One language for all** – Translates every machine's own dialect into one standard, making machines easy to compare
- **Lesser surprises** – Doesn't prevent failures, but changes when and with what information you find out about them
- **One platform, your pace** – Edge as the foundation, Cloud for the full range of possibilities.
