

Inspections

Electrical, controls & safety inspections

The **Electrical, Controls & Safety Inspection** provides a comprehensive assessment of the electrical system, control system, and all safety-related components. It includes inspection of safety devices, auxiliary equipment, electrical cabinets, power supply, sensors, and electrical components.

In addition, thermal inspections, PLC program comparisons with the OEM version, and network topology and quality analyses (e.g. PROFINET, PROFIBUS, or EtherNet/IP) help identify deviations at an early stage.

Your benefits

- Increased plant safety
- Early fault detection
- Higher equipment availability
- Optimised system performance
