

CNS-RFID-01/1S

RFID Sensor

---

Instruction Manual (communication)

\*Thankyou for using our products

\*This manual explains how to use the product and safety matters.

\* Read this manual thoroughly and pay attention to safety during use.

\* Keep this manual in a suitable place for easy reference at anytime.

## Safety attention

Please be sure to follow the precautions and major safety-related shown here.

### **Warning**

Violation of the content requirements shown in this warning during operation may result in death or serious injury.

### **Note**

Violation of the content requirements shown in this precaution during operation may result in personal injury or property damage.

### **Remind**

In order to enable you to use the product correctly, the relevant use items in the main text record the matters that the user must comply with.

# 1 SAFETY

---

## 1.1 SAFETY WARNINGS

The precautions suggested here are intended to enable you to use the product safely and correctly, so as not to cause harm and damage to you and others. Please fully understand its content before using this product.

### Note

Do not use this product near explosive gas, flammable gas, corrosive, water-prone environment and combustible materials, otherwise it may cause fire or injury.

Setup, connection, operation, inspection and fault diagnosis should be carried out by appropriately qualified person, otherwise it may cause fire, injury or product damage.

#### **Setting**

Please install the sensor in the machine frame, otherwise the equipment may be damaged.

#### **Connecting**

The power input voltage must be controlled within the rated range, otherwise it may cause a fire.

Please connect according to the connection diagram, otherwise it may cause a fire.

Do not forcibly bend, pull or clamp the cable, otherwise it may cause a fire.

Please use the cable according to the specified size, otherwise it may cause a fire.

#### **Maintenance and inspection**

Maintenance and inspection must be performed after turning off the power, otherwise it may cause injury.

When conducting insulation resistance measurement and insulation withstand voltage test, please do not touch, otherwise it may cause electric shock.

#### **Repair and disassembly**

Do not disassemble or modify the sensor, otherwise it may cause injury or damage to the device. For internal inspection or repair, please contact our company.

## 2 FOREWORD

---

CNS-RFID-01/1S allows reading and writing operations through a variety of communication methods. This article will explain the communication methods in detail.

### 2.1 PRODUCT COMPOSITION

| Model          | Power input |
|----------------|-------------|
| CNS-RFID-01/1S | DC 24V      |

Please check if the model is the same

### 2.2 WIRE DEFINITION

## 3 RS-232 COMMUNICATION CONNECTION

---

### 3.1 CONNECTION

The host computer and the sensor are connected as follows.

## 3.2 COMMUNICATION SETTINGS

Use the RS232 communication HS protocol, after determining the protocol to be used, you need to set the CNS-RFID-01/1S before using it. Configure the parameters through the Hinson configuration software on the computer. For specific configuration connections, see <CNS-RFID-01/1S Usage>. The configuration parameters are as follows:

| Parameter name                         | Parameter                                                                                          | Default parameters |
|----------------------------------------|----------------------------------------------------------------------------------------------------|--------------------|
| Device interface and protocol          | 1: RS232-HS protocol<br>2: RS485-HS protocol<br>3: CAN Bus-HS protocol<br>4: RS485-Modbus protocol | RS232-HS protocol  |
| Device address                         | 1-127                                                                                              | 127                |
| RS232 communication baud rate          | 1: 19200bps<br>2: 115200bps                                                                        | 115200bps          |
| RS232 reading mode                     | 1: Query mode<br>2: Card reader trigger mode<br>3: Timed broadcast mode                            | Query mode         |
| RS232 card reader trigger frame number | 1: 1 frame<br>2: 2 frame<br>3: 3 frame<br>4: 4 frame<br>5: Continuous sending                      | 1 frame            |
| RS232 broadcast interval               | 1: 5ms<br>2: 10ms<br>3: 20ms<br>4: 50ms<br>5: 100ms                                                | 5ms                |

## 3.3 COMMUNICATE WITH HS PROTOCOL

### 3.3.1 Communication specifications

| Parameter            | Parameter information            | Default setting |
|----------------------|----------------------------------|-----------------|
| Way of communication | Point to point                   |                 |
| Accept/send method   | Full duplex communication mode   |                 |
| Broadcast mode       | 5ms , 10ms , 20ms , 50ms , 100ms | Not broadcast   |
| Communication ID     | 1 - 127                          | 127             |
| Communication rate   | 19200bps , 115200bps             | 115200bps       |
| Data bit             | 8 bit                            | 8 bit           |
| Check bit            | No verification                  | No verification |
| Stop bit             | 1 bit                            | 1 bit           |

### 3.3.2 Master-Slave Communication Sequence

#### Query mode

The master station sends an inquiry to one slave station, and the slave station performs processing and responds.

| Serial number | Name                      | Content               |
|---------------|---------------------------|-----------------------|
| T1            | Response waiting interval | Within 1ms            |
| T3            | Send waiting time         | Recommended 5ms -30ms |

#### Broadcast mode

The slave station automatically broadcasts according to the set time interval

| Serial number | Name               | Content                                    |
|---------------|--------------------|--------------------------------------------|
| T1            | Broadcast interval | Configure in Hinson configuration software |

### 3.3.3 Communication protocol

The host control can read card data and write card data. The communication protocol includes two parts. The two operating protocols are described in detail below

#### .Read card data protocol

RFID-01 sensor return data mode includes inquiry mode, card reading trigger mode, and timed broadcast mode.

**Query mode:** After the RFID sensor receives the data from the host controller, it returns the data

**Card reader trigger mode:** The RFID sensor actively sends data after reading the card information

**Timed broadcast mode:** RFID sensor automatically sends data according to the set time interval

#### The master asks for data

Inquiry about the data format of the card reader

|                    |              |
|--------------------|--------------|
| Flag               | 1Byte        |
|                    | 1Byte        |
|                    | 1Byte        |
|                    | 1Byte        |
|                    | 1Byte        |
| Communication flag | 1Byte        |
| Check code         | 1Byte (Low)  |
|                    | 1Byte (High) |

●Flag (5Byte) 0x52 0x43 0x6f 0x64 0x65

●Communication flag (1Byte)

RS232 free protocol mode: invalid data 0x00

●Check code (2Byte) 0x3F 0xFD

### Return data from the station

The RFID sensor is in inquiry mode, card reading trigger mode, and timed broadcast mode, and the returned data grid is consistent. Response data format of slave sensor

|                             |              |
|-----------------------------|--------------|
| <b>Flag</b>                 | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
| <b>Communication flag</b>   | 1Byte        |
| <b>Card reading status</b>  | 1Byte        |
| <b>Card signal strength</b> | 1Byte        |
| <b>Card data</b>            | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
|                             | 1Byte        |
| <b>Check code</b>           | 1Byte (Low)  |
|                             | 1Byte (High) |

●Flag (5Byte)

0x52 0x43 0x6f 0x64 0x65

●Communication flag (1Byte)

RS232-HS protocol mode: invalid data 0x00;

●Card reading status (1Byte)

0x00: RFID sensor is not card-reading status;

0x01: The RFID sensor is reading the card status;

●Card signal strength (1Byte)

0x00-0x07: Read the card signal strength, 0x00 signal strength is the weakest, 0x07 signal strength is the strongest;

●Card data (8Byte)

The RFID sensor will automatically record and save the data of the most recent card reading, so that the host computer can determine the landmark at anytime;

When the read data length is set to 4Byte: the first 4Bytes are valid data in the card, and the last 4bytes are invalid data 0x00;

When the read data length is set to 8Byte: all 8Byte data is valid;

●Check code (2Byte)

The result of the operation of CRC16. For details, please see the checksum calculation formula.

## .Write card data protocol

|                           | 1Byte (High) |

- Flag (5Byte)

0x57 0x43 0x6f 0x64 0x65

- Communication flag (1Byte)

RS232 free protocol mode: invalid data 0x00;

- Card data (8Byte)

When the read data length is set to 4Byte: the first 4Bytes are valid data in the card, and the last 4bytes are invalid data 0x00;

When the read data length is set to 8Byte: all 8Byte data is valid;

- Check code (2Byte)

The result of the operation of CRC16. For details, please see the checksum calculation formula.

## Return data from the station

|                           |              |
|---------------------------|--------------|
| <b>Flag</b>               | 1Byte        |
|                           | 1Byte        |
|                           | 1Byte        |
|                           | 1Byte        |
|                           | 1Byte        |
| <b>Communication flag</b> | 1Byte        |
| <b>Write status</b>       | 1Byte        |
| <b>Check code</b>         | 1Byte (Low)  |
|                           | 1Byte (High) |

- Flag (5Byte)

0x57 0x43 0x6f 0x64 0x65

- Communication flag (1Byte)

RS232 free protocol mode: invalid data 0x00;

- Write status (1Byte)

0x00: Write successfully;

0x01: Write error or the card is locked inside;

0x02: No card that can be written is detected;

- Check code (2Byte)

The result of CRC16 operation. For details, please see the checksum calculation formula.

## 4 RS-485 COMMUNICATION CONNECTION

### 4.1 CONNECTION

Use the cable to connect the host computer and the sensor as follows

### 4.2 COMMUNICATION SETTINGS

The RS485 communication is divided into two protocols, namely the modbus protocol and the HS protocol. After determining the protocol to be used, you need to set the CNS-RFID-01/1S before using it.

Since it is not possible to directly use RS485 to set the parameters of the device, it is necessary to configure the parameters through the Hinson configuration software on the computer side. Please refer to <CNS-RFID-01/1S Usage Part> for specific configuration and connection. The configuration parameters areas follows:

| Parameter name                       | Parameter list                                                                                     | Setting parameters    |
|--------------------------------------|----------------------------------------------------------------------------------------------------|-----------------------|
| <b>Device interface and protocol</b> | 1: RS232-HS protocol<br>2: RS485-HS protocol<br>3: CAN Bus-HS protocol<br>4: RS485-modbus protocol | RS485-modbus protocol |
| <b>Device address</b>                | 1-127                                                                                              | 127                   |
| <b>RS485 communication baud rate</b> | 1: 9600bps<br>2: 19200bps<br>3: 38400bps<br>4: 57600bps                                            | 115200bps             |

|                           |                                                       |                 |
|---------------------------|-------------------------------------------------------|-----------------|
|                           | 5: 115200bps                                          |                 |
| <b>RS485 parity check</b> | 1: No verification<br>2: Odd parity<br>3: Even parity | No verification |
| <b>RS485 Stop bit</b>     | 1: 1bit<br>2: 1.5bit<br>3: 2bit                       | 1 bit           |

### 4.3 CONTROLLED BY MODBUS PROTOCOL

#### 4.3.1 Communication specifications

|                             | Parameter information                                 | Default setting |
|-----------------------------|-------------------------------------------------------|-----------------|
| <b>way of communication</b> | Single master/multi-slave mode                        |                 |
| <b>Operating mode</b>       | Modbus RTU mode                                       | RTU mode        |
| <b>Accept/send method</b>   | Half-duplex communication mode                        |                 |
| <b>Communication ID</b>     | 1-127 configurable                                    | 127             |
| <b>Communication rate</b>   | 9600bps , 19200bps , 38400bps , 576000bps , 115200bps | 115200bps       |
| <b>Data bit</b>             | 8 bit                                                 | 8 bit           |
| <b>Check Digit</b>          | No verification; Odd parity; Even parity              | No verification |
| <b>Stop bit</b>             | 1 bit; 2 bit                                          | 1 bit           |

#### 4.3.2 Master-Slave Communication Sequence

The communication mode of Modbus protocol is single-master station/multi-slave station mode. The master station sends an inquiry to one slave station, and the slave station performs processing and responds.

| Serial number | Name              | Content                                                                                                                                                                                                                                                                                                                                                |
|---------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C3.5          | Quiet interval    | As the sending waiting time, please be sure to leave an interval of 3.5 words or more. If the number of words is not full, the sensor cannot respond. When the communication speed exceeds 19200 bps, please keep the interval at least 1.75 ms.                                                                                                       |
| T1            | Send waiting time | After receiving the inquiry from the master station, the slave station switches the communication line to the sending state, the time until it starts to reply to the response. In order to send a waiting time of 10 ms. The actual sending waiting time will become the static interval (C3.5) + command processing time + sending waiting time (T1) |

### 4.3.3 Information

Information format

#### ■ Query information structure

| Slave address code | function code | Data  |
|--------------------|---------------|-------|
| 1 Byte             | 1 Byte        | 2Byte |

#### ●Slave address

The specified slave address is the address of the slave sensor configured by the configuration software.

#### ●Function code

The function code information length supported by the sensor is as follows.

| Function code | Features                         |
|---------------|----------------------------------|
| 04h           | Read data from the save register |
| 10h           | Write multiple save registers    |

#### ●Data

#### ■ Data related to setting function codes.

#### ■ Response information structure

After receiving the inquiry information from the station, there are three response states, namely, normal response, no response and abnormal response.

The information structure of the response is the same as the information structure of the query.

| Slave address code | Function code | Data   |
|--------------------|---------------|--------|
| 1 Byte             | 1 Byte        | 2 Byte |

#### ●Normal response

After receiving the inquiry from the master station, the slave station will perform the required processing and reply with a response.

### 4.3.4 Register address

Write multiple registers Write card operation (16)

| Register address | Write value | Content                    |
|------------------|-------------|----------------------------|
| 2000             | 0-255       | RFID card first byte data  |
| 2001             | 0-255       | RFID card second byte data |
| 2002             | 0-255       | RFID card 3rd byte data    |
| 2003             | 0-255       | RFID card 4th byte data    |
| 2004             | 0-255       | RFID card 5th byte data    |
| 2005             | 0-255       | RFID card 6th byte data    |
| 2006             | 0-255       | RFID card 7th byte data    |
| 2007             | 0-255       | RFID card 8th byte data    |

The data can be read only when the read length is set to 8 bytes.

The RFID sensor will automatically record and save the data of the most recent card reading so that the host controller can determine the landmark at anytime.

| Register address | Read value | Content                                                                                                                                   |
|------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1000             | 0 - 2      | Write status:<br>0: The data is written successfully;<br>1: Data writing fails or the card is locked;<br>2: No writable card is detected; |
| 1001             | 0 - 1      | Reading status:<br>0: No card<br>1: Card reading status;                                                                                  |
| 1002             | 0 - 7      | Card reading signal strength indicator;<br>0: The weakest signal;<br>7: The Strongest signal;                                             |
| 1003             | 00-255     | RFID card first byte data                                                                                                                 |
| 1004             | 00-255     | RFID card second byte data                                                                                                                |
| 1005             | 00-255     | RFID card 3rd byte data                                                                                                                   |
| 1006             | 00-255     | RFID card 4th byte data                                                                                                                   |
| 1007             | 00-255     | RFID card 5th byte data                                                                                                                   |
| 1008             | 00-255     | RFID card 6th byte data                                                                                                                   |
| 1009             | 00-255     | RFID card 7th byte data                                                                                                                   |
| 1010             | 00-255     | RFID card 8th byte data                                                                                                                   |

When the read length is set to 8 bytes, the data can be read, otherwise the data is 00;

## 4.4 COMMUNICATION WITH HS PROTOCOL

### 4.4.1 Communication specifications

|                    | Parameter information                                 | Default setting |
|--------------------|-------------------------------------------------------|-----------------|
| Communication way  | Single master/multi-slave mode                        |                 |
| Accept/send method | Half-duplex communication mode                        |                 |
| Communication ID   | 1-127 configurable                                    | 127             |
| Communication rate | 9600bps , 19200bps , 38400bps , 576000bps , 115200bps | 115200bps       |
| Data bit           | 8 bit                                                 | 8 bit           |
| Check Digit        | No verification;Odd parity;Even parity                | No verification |
| Stop bit           | 1 bit;2 bit                                           | 1 bit           |

#### 4.4.2 Communication protocol

The host controller can read and write card operations on the card. The communication protocol includes two parts, read card data and write card data. The two operating protocols are described in detail below;

##### .Read card data protocol

###### Card reading operation data flow

In the RS485 mode, the RFID-1S sensor returns to the data mode only in the Query mode.

**Query mode:** After the RFID sensor receives the data from the host controller, it returns the data.

##### The master asks for data

Inquiry about the data format of the card reader

|                           |                |
|---------------------------|----------------|
| <b>Flag</b>               | 1Byte          |
|                           | 1Byte          |
|                           | 1Byte          |
|                           | 1Byte          |
|                           | 1Byte          |
| <b>Communication flag</b> | 1Byte          |
| <b>Check code</b>         | 1Byte ( Low )  |
|                           | 1Byte ( High ) |

- Flag ( 5Byte )

0x52 0x43 0x6f 0x64 0x65

- Communication flag ( 1Byte )

Slave station RFID sensor address, the range is 0x01-0x7F;

- Check code ( 2Byte )

The result of the operation of CRC16. For details, please see the checksum calculation formula.

##### Return data from the station

RFID sensor returns data in Query mode

|                             |       |
|-----------------------------|-------|
| <b>Flag</b>                 | 1Byte |
|                             | 1Byte |
|                             | 1Byte |
|                             | 1Byte |
|                             | 1Byte |
| <b>Communication flag</b>   | 1Byte |
| <b>Card reading status</b>  | 1Byte |
| <b>Card signal strength</b> | 1Byte |
| <b>Card data</b>            | 1Byte |
|                             | 1Byte |

|                   |              |
|-------------------|--------------|
|                   | 1Byte        |
|                   | 1Byte        |
|                   | 1Byte        |
|                   | 1Byte        |
|                   | 1Byte        |
|                   | 1Byte        |
| <b>Check code</b> | 1Byte (Low)  |
|                   | 1Byte (High) |

- Flag (5Byte)

0x52 0x43 0x6f 0x64 0x65

- Communication flag (1Byte)

Slave station RFID sensor address, the range is 0x01-0x7F;

- Card reading status (1Byte)

0x00: RFID sensor is not card-reading status;

0x01: The RFID sensor is reading the card status;

- Card signal strength (1Byte)

0x00-0x07: Read the card signal strength, 0x00 signal strength is the weakest, 0x07 signal strength is the strongest;

- Card data (8Byte)

The RFID sensor will automatically record and save the data of the most recent card reading so that the host controller can determine the landmark at anytime.

When the read data length is set to 4Byte: the first 4Bytes are valid data in the card, and the last 4bytes are invalid data 0x00;

When the read data length is set to 8Byte: all 8Byte data is valid;

- Check code (2Byte)

The result of the operation of CRC16. For details, please see the checksum calculation formula.

## .Write card data protocol

### Card write operation data flow

### Master station sends data

Write card data format

|                           |                    |
|---------------------------|--------------------|
| <b>Flag</b>               | 1Byte              |
|                           | 1Byte              |
|                           | 1Byte              |
|                           | 1Byte              |
|                           | 1Byte              |
| <b>Communication flag</b> | 1Byte              |
| <b>Write card data</b>    | 1Byte(Card data 1) |
|                           | 1Byte(Card data 2) |
|                           | 1Byte(Card data 3) |
|                           | 1Byte(Card data 4) |
|                           | 1Byte(Card data 5) |
|                           | 1Byte(Card data 6) |
|                           | 1Byte(Card data 7) |
|                           | 1Byte(Card data 8) |
| <b>Check code</b>         | 1Byte (Low)        |
|                           | 1Byte (High)       |

- Flag bit (5Byte)

0x57 0x43 0x6f 0x64 0x65

- Communication flag (1Byte)

Slave station RFID sensor address, the range is 0x01-0x7F;

- Card data (8Byte)

When the read data length is set to 4Byte: the first 4Bytes are valid data in the card, and the last 4bytes are invalid data 0x00;

When the read data length is set to 8Byte: all 8Byte data is valid;

- Check code (2Byte)

The result of the operation of CRC16. For details, please see the checksum calculation formula.

### Return data from the station

|                                     |              |
|-------------------------------------|--------------|
| <b>Return data from the station</b> | 1Byte        |
|                                     | 1Byte        |
|                                     | 1Byte        |
|                                     | 1Byte        |
|                                     | 1Byte        |
| <b>Communication flag</b>           | 1Byte        |
| <b>Write status</b>                 | 1Byte        |
| <b>Check code</b>                   | 1Byte (Low)  |
|                                     | 1Byte (High) |

- Flag bit (5Byte)

0x57 0x43 0x6f 0x64 0x65

- Communication flag (1Byte)

Slave station RFID sensor address, the range is 0x01-0x7F;

- Write status (1Byte)
  - 0x00: Write successfully;
  - 0x01: Write error or the card is locked inside;
  - 0x02: No card that can be written is detected;
- Check code (2Byte)

The result of the operation of CRC16. For details, please see the checksum calculation formula.

## 5 CAN BUS COMMUNICATION

### 5.1 CONNECTION

### 5.2 COMMUNICATION SETTINGS

The CAN bus uses the HS protocol, and you need to set the CNS-RFID-01/1S before using it. Because it is not possible to directly use the CAN bus to set the parameters of the device, it is necessary to configure the parameters through the Hinson configuration software on the computer side. Please refer to <CNS-RFID-01/1S Usage Part> for specific configuration and connection. The configuration parameters areas follows:

| Parameter name                | Parameter list                                                                                     | Setting parameters  |
|-------------------------------|----------------------------------------------------------------------------------------------------|---------------------|
| Device interface and protocol | 1: RS232-HS protocol<br>2: RS485-HS protocol<br>3: CAN Bus-HS protocol<br>4: RS485-modbus protocol | CAN Bus-HS protocol |
| Device address                | 1-127                                                                                              | 127                 |

|                                                 |                                                                               |            |
|-------------------------------------------------|-------------------------------------------------------------------------------|------------|
| <b>CAN bus baud rate</b>                        | 1: 125K<br>2: 250K<br>3: 500K<br>4: 1000K                                     | 1000K      |
| <b>CAN bus read mode</b>                        | 1: Query mode<br>2: Card reader trigger mode<br>3: Timed broadcast mode       | Query mode |
| <b>CAN bus card reader trigger frame number</b> | 1: 1 frame<br>2: 2 frame<br>3: 3 frame<br>4: 4 frame<br>5: Continuous sending | 1 frame    |
| <b>CAN bus broadcast interval</b>               | 1: 5ms<br>2: 10ms<br>3: 20ms<br>4: 50ms<br>5: 100ms                           | 5ms        |

### 5.3 COMMUNICATION SPECIFICATIONS

| Features                            | Parameter                                            | Default parameters |
|-------------------------------------|------------------------------------------------------|--------------------|

#### 5.3.1 Master-Slave Communication Sequence

##### Query mode

The master station sends an inquiry to one slave station, and the slave station performs processing and responds.

| Serial number | Name                      | Content               |
|---------------|---------------------------|-----------------------|
| T1            | Response waiting interval | Within 1ms            |
| T3            | Send waiting time         | Recommended 5ms -30ms |

### Broadcast mode

The slave station automatically broadcasts according to the set time interval

| Serial number | Name               | Content                                    |
|---------------|--------------------|--------------------------------------------|
| T1            | Broadcast interval | Configure in Hinson configuration software |

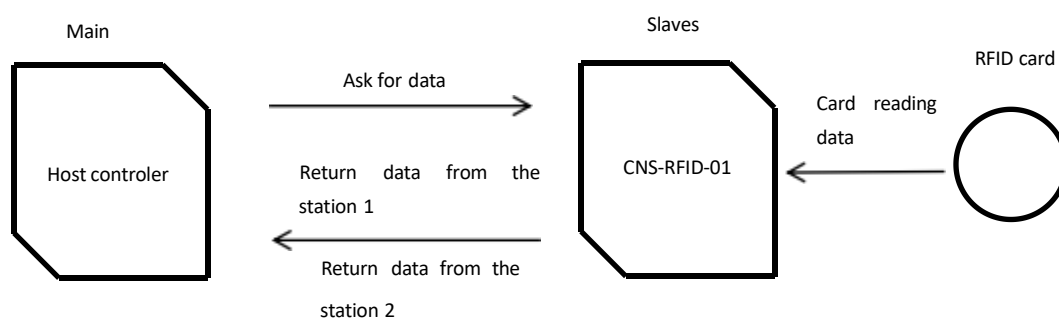

## 5.4 INFORMATION

5.4.1 The host controller can read and write card operations on the card. The communication protocol includes two parts, read card data and write card data. The two operating protocols are described in detail below;

### 5.4.2 Data protocol

The next return data in CAN bus mode is divided into two frames of data return.

#### Card reading operation data flow

RFID-01 sensor return data mode includes query mode, card reading trigger mode, and timed broadcast mode.

Query mode: After the RFID sensor receives the data from the host controller, it returns the data

Card reading trigger mode: The RFID sensor actively sends data after reading the card information

Timed broadcast mode: RFID sensor automatically sends data according to the set time interval

#### Reading card data frame

The query data can read card data and write data to the card, and realize the card reading and writing functions by sending two kinds of data to the slave RFID sensor.

|                        |     |        |        |        |        |        |        |        |
|------------------------|-----|--------|--------|--------|--------|--------|--------|--------|
| Can ID                 | DLC | Data   |        |        |        |        |        |        |
|                        |     | 0 Byte | 1 Byte | 2 Byte | 3 Byte | 4 Byte | 5 Byte | 6 Byte |
| Sensor setting address | 7   | Data   |        |        |        |        |        |        |

#### ● Data (1-7 Byte)

Card reading mode: send any data with a data length of 1-7Byte;

## Write card data frame

The query data can read card data and write data to the card, and realize the card reading and writing functions by sending two kinds of data to the slave RFID sensor.

| Can ID                 | DLC | Data   |        |        |        |        |        |        |        |
|------------------------|-----|--------|--------|--------|--------|--------|--------|--------|--------|
|                        |     | 0 Byte | 1 Byte | 2 Byte | 3 Byte | 4 Byte | 5 Byte | 6 Byte | 7 Byte |
| Sensor setting address | 8   | Data   |        |        |        |        |        |        |        |

### ● Data (1-8 Byte)

Write card mode: send data length 8Byte;

|                     |                     |                     |                     |                     |                     |                     |                     |
|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| Card data 1 (1Byte) | Card data 2 (1Byte) | Card data 3 (1Byte) | Card data 4 (1Byte) | Card data 5 (1Byte) | Card data 6 (1Byte) | Card data 7 (1Byte) | Card data 8 (1Byte) |
|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|

## Return data frame

The RFID sensor will automatically record and save the data of the most recent card reading so that the host controller can determine the landmark at anytime.

### The first frame of data

| Can ID                 | DLC | Data        |                     |                     |                      |             |             |             |             |
|------------------------|-----|-------------|---------------------|---------------------|----------------------|-------------|-------------|-------------|-------------|
|                        |     | 0 Byte      | 1 Byte              | 2 Byte              | 3 Byte               | 4 Byte      | 5 Byte      | 6 Byte      | 7 Byte      |
| Sensor setting address | 8   | Data number | Card reading status | Card reading status | Card signal strength | Card data 1 | Card data 2 | Card data 3 | Card data 4 |

|                     |                      |                    |                        |                     |                     |                     |                     |
|---------------------|----------------------|--------------------|------------------------|---------------------|---------------------|---------------------|---------------------|
| Data number (1Byte) | Write status (1Byte) | Read status(1Byte) | Signal strength(1Byte) | Card data 1 (1Byte) | Card data 2 (1Byte) | Card data 3 (1Byte) | Card data 4 (1Byte) |
|---------------------|----------------------|--------------------|------------------------|---------------------|---------------------|---------------------|---------------------|

Data identification (1Byte)

0x01: The first frame of data identification;

Write status (1Byte)

0x00: Write successfully;

0x01: Write error or the card is locked inside;

0x02: No card that can be written is detected;

Read status (1Byte)

0x00: RFID sensor is not card-reading status;

0x01: The RFID sensor is reading the card status;

Card signal strength (1Byte)

0x00-0x07: Read the card signal strength, 0x00 signal strength is the weakest, 0x07 signal strength is the strongest;

Card data 1 (1Byte) ;

The first byte of data in the card;

Card data 2 (1Byte);

-  The 2nd byte data in the card;
-  Card data 3 (1Byte);
- The 3rd byte data in the card;
-  Card data 4 (1Byte);
- The 4th byte data in the card;

### The second frame of data

| Can ID                 | DLC | Data        |                   |                     |                      |             |             |             |             |
|------------------------|-----|-------------|-------------------|---------------------|----------------------|-------------|-------------|-------------|-------------|
|                        |     | 0 Byte      | 1 Byte            | 2 Byte              | 3 Byte               | 4 Byte      | 5 Byte      | 6 Byte      | 7 Byte      |
| Sensor setting address | 8   | Data number | Write card status | Card reading status | Card signal strength | Card data 5 | Card data 6 | Card data 7 | Card data 8 |

|                             |                     |                    |                         |                     |                     |                     |                     |
|-----------------------------|---------------------|--------------------|-------------------------|---------------------|---------------------|---------------------|---------------------|
| Data identification (1Byte) | Write status(1Byte) | Read status(1Byte) | Signal strength (1Byte) | Card data 5 (1Byte) | Card data 6 (1Byte) | Card data 7 (1Byte) | Card data 8 (1Byte) |
|-----------------------------|---------------------|--------------------|-------------------------|---------------------|---------------------|---------------------|---------------------|

-  Data identification (1Byte)
  - 0x02: The second frame of data identification;
-  Write status (1Byte)
  - 0x00: Write successfully;
  - 0x01: Write error or the card is locked inside;
  - 0x02: No card that can be written is detected;
-  Read status (1Byte)
  - 0x00: RFID sensor is not card-reading status;
  - 0x01: The RFID sensor is reading the card status;
-  Card signal strength (1Byte)
  - 0x00-0x07: Read the card signal strength, 0x00 signal strength is the weakest, 0x07 signal strength is the strongest;
- Card data 5 (1Byte);
  - The 5th byte data in the card;
-  Card data 6 (1Byte);
  - The 6th byte data in the card;
-  Card data 7 (1Byte);
  - The 7th byte data in the card;
-  Card data 8 (1Byte);
  - The 8th byte data in the card;

## 6 AFTER-SALES AND TECHNICAL SUPPORT

---

### 6.1 WARRANTY PERIOD

CNS-RFID-01/1S provides a limited time warranty. If the product cannot be used normally due to quality problems, design defects and other reasons, we will carry out after-sales maintenance for free during the warranty period.

. Warranty period: 2 years from sale.

### 6.2 WARRANTY SCOPE

If the product is within the scope of the warranty during the warranty period, we will repair or replace it free of charge

- This product's warranty and after-sales service are only limited to mainland China;
- The product cannot be used normally when it is out of the box due to transportation;
- Failure to work normally caused by damage to the product's own components;
- Product design defects cannot be used normally;

### 6.3 EXEMPTION SCOPE

Please pay attention to the following conditions during the use of the product, we will not provide free after-sales and warranty.

- . Failure to install the product according to the instructions correctly, causing damage to the product;
- . Use this product under unsuitable environments and conditions, causing product damage;
- . Damage to the product due to non-compliance with the product specification;
- . Disassemble or repair the product without the permission of the company;
- . Product damage caused by irresistible external forces such as natural disasters, fires, etc;

### 6.4 TECHNICAL SUPPORT

Guangdong Hinson Technology Co. Ltd. website: [www.hinson-xs.com](http://www.hinson-xs.com)

Technical Support      Wechat: 13928672909

WhatsApp: +86 13928672909

## .Appendix I:

### C language CRC check function

cBuffer: Calculate the array of CRC check codes.

iBufLen: The length of the array.

unsigned int CRC\_Verify(unsigned char \*cBuffer, unsigned int iBufLen)

```
{
    unsigned inti, j;                //define wPolynom 0xA001
    unsigned intwCrc = 0xffff;
    unsigned int wPolynom = 0xA001;
    /*-----*/
    for (i = 0; i < iBufLen; i++)
    {
        wCrc ^= cBuffer[i];
    for (j = 0; j < 8; j++)
        {
            if (wCrc & 0x0001)
            {   wCrc = (wCrc >> 1) ^ wPolynom;   }
            else
            {   wCrc = wCrc >> 1;   }
        }
    }
    return wCrc;
}
```

### PLC write CRC check function

The CRC-16 code is composed of two bytes. At the beginning, each bit of the CRC register is preset to 1 (0xffff), and then the CRC register is XORed with the 8-bit data, and then the CRC register is changed from high to Shift low, add zero at the position of the most significant bit (MSB), and the least significant bit (LSB), which has been moved out of the CRC register after shifting) If it is 1, put the register with the predefined polynomial code (16#A001) XOR is performed, otherwise if LSB is zero, XOR is not required. Repeat the above shift from high to low 8 times, the first 8-bit data is processed, use the value of the CRC register at this time and the next 8-bit data to XOR and perform 8 shifts like the previous data Bit. After all characters are processed, the value in the CRC register is the final CRC value.

he following is the calculation process of CRC:

Setup the CRC register and assign FFFF(hex) to it.

XOR the first 8-bit character of the data with the lower 8 bits of the 16-bit CRC register, and store the result in the CRC register.

The CRC register is shifted one bit to the right, the MSB is zeroed, and the LSB is shifted out and checked.

If the LSB is 0, repeat the third step; if the LSB is 1, the CRC register is XORed with the polynomial code.

Repeat steps 3 and 4 until all 8 shifts are completed. At this point, an 8-bit data has been processed.

Repeat steps 2 to 5 until all data is processed.

The content of the final CRC register is the CRC value.

Input parameters:

Pointer of the data area to be verified, the first byte is the data length

LD0      DataBuff      IN      DWORD

Network 1

LD      SM0.0

MOVW    16#FFFF, AC0      // Initialize the CRC register

BTI      \*LD0, LW4      // The first byte of the data buffer is the data length

MOVD    LD0, LD6

INCD    LD6      // Pointer to the first byte to be processed

Network 2

LD      SM0.0

FOR      AC2, +1, LW4      // Start looping through each byte

Network 3

LD      SM0.0

XORB    \*LD6, AC0      // The byte is first XORed with the low bit of the CRC register

Network 4

LD      SM0.0

FOR      AC1, +1, +8      // Shift processing loop, processing 8 bits of a byte

Network 5

LD      SM0.0

SRW      AC0, 1      // CRC register shifted one bit to the right

Network 6

LD      SM1.1      // If the shift out bit is 0, then enter the next cycle

XORW    16#A001, AC0      // If the shifted out bit is 1, the CRC register is XORed with  
polynomial 16#A001

Network 7

NEXT

Network 8

LD      SM0.0

INCD    LD6      // Pointer plus 1 points to the next byte

Network 9

NEXT

Network 10

LD      SM0.0

SWAP    AC0      // Exchange the high and low bytes of the CRC register

MOVW    AC0, \*LD6      // CRC check value is written to the end of the data area

Remarks: After the PLC writes the CRC check function, use it to calculate the CRC check code, compare the check code with the CRC check code calculated by the SinloCRC16 check tool, if they are not the same, the CRC check written by the PLC The test function must be incorrect.
