## WARNING

Using these products may prove hazardous. Therefore, never use our products for purposes other than those they were designed for. Customers must ensure that all persons using these products are familiar with their correct use and the related necessary safety precautions. Please bear in mind that any of these products may inflict harm when used incorrectly or subjected to excessive loads. As a manufacturer and supplier of wire ropes with many years of experience, our recommendations are nonbinding but based on experience.

TEUFELBERGER®, 拖飞宝®, REDAELLI®, PLASTFILL®, SUPERFILL®, PACK®, 7MINE®, IPERFLEX® and FLEXMINE® are internationally registered trademarks of the TEUFELBERGER Group. Subject to technical modifications, typesetting and printing errors.

# TEUFELBERGER-REDAELLI:

## Leading in High Performance Steel Wire Ropes with Added Value

### The essence of Teufelberger-Redaelli

---

We at Teufelberger-Redaelli understand your day-to-day challenges and solve them together with you. We design, develop and manufacture high performance steel wire ropes that create added value by enhancing the efficiency and safety of your applications. Customers can expect more from our innovative steel wire ropes, our services, our experienced experts in development, our application engineering team, as well as our technical and commercial sales support – all around the globe. Being a family enterprise, we value and understand the great importance of successful, long-standing business relationships. Our commitment does not begin and end solely with the supply of premium quality steel wire ropes, but we also assist and support you throughout your work processes when it comes to optimizing efficiency and costs.

### Application-specific (field-proven) expertise and product portfolio

---

At Teufelberger-Redaelli, we want to take the burden off your shoulders when making the right choices and choosing the most suitable rope for your application. Our specialists have a clear understanding of the most important criteria when considering the most suitable steel wire rope design for your application, and are therefore able to provide you with an optimal product recommendation. Every single application requires a specific, custom-tailored solution.

Rotation-resistant and non-rotation-resistant high performance steel wire ropes from Teufelberger-Redaelli are used for a variety of applications such as:

- heavy-duty lifting applications in construction, cargo handling in harbors and on ships, and in niche industries
- cranes in offshore and onshore oil exploration
- mining
- ropeways for the transport of passengers and goods
- forestry cranes and winches
- personal protective equipment against falls from a height

Four manufacturing sites for steel wire ropes and a combined total of more than 425 years of rope-making experience tally up to a unique wealth of expertise, and an unmatched and proven production standard. The combined result is a high degree of flexibility that allows us to keep delivery times to a minimum.

### Service and support prior to and after steel wire rope selection

---

We know that high performance steel wire ropes are able to unleash their full potential only if hoisting systems have been set up optimally and the ropes have been installed correctly. Therefore, we also provide support during project planning, installation, and subsequent careful handling to maximize rope lifetimes. After all, the purchasing costs are just the tip of the iceberg.

# GETTING THE BEST PERFORMANCE OUT OF YOUR HOISTING SYSTEM

Day in and day out, hoists/winders ensure that miners and their equipment are transported safely up and down the mine shaft, and that the ore mined is hoisted to the surface in a reliable, fast and efficient way. Whether they operate in ultra-deep or shallow shafts, or in perhaps aggressive salty, acidic or wet environments, these hoists are inseparably linked to the world of underground mining. Hoists/winders can only function efficiently and successfully if the installed ropes deliver the necessary and optimum performance.

Customers from around the globe have, for many years and in various climatic conditions, relied on quality products made by Teufelberger-Redaelli. Time and time again, we have improved and adapted the characteristics of our ropes in order to provide our customers with the best and most cost-effective solutions.

## What matters most?

- ✓ Safety and reliability in use
- ✓ Reduced costs
- ✓ Higher efficiency
- ✓ High wear resistance
- ✓ High bending fatigue performance
- ✓ State of the art corrosion protection
- ✓ High resistance to shock loads
- ✓ Robustness against twisting and torque buildup
- ✓ Low elongation

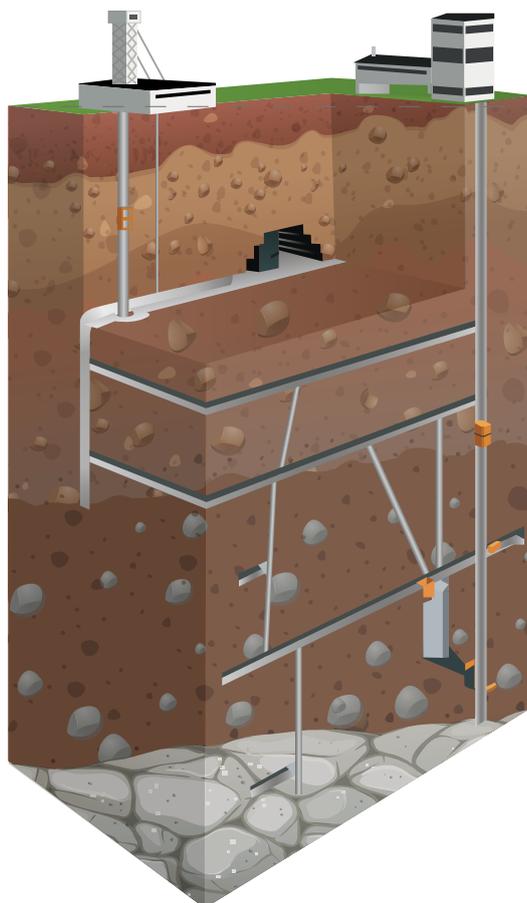

## Know your costs along the way

The initial purchasing costs for a wire rope are just the tip of the iceberg. Teufelberger-Redaelli will proactively work with you, providing technical support to reduce or eliminate the costs that become evident along the way.

## Total Cost of Ownership

### Visible costs

### Invisible costs

- Initial purchasing costs for a wire rope
- Lost production time due to rope changes, unexpected rope failures and rope maintenance.
- Increased rope maintenance costs due to necessary drum end cuts at short intervals.
- Additional rope purchase costs due to short rope service life.
- Additional rope installation costs and lost production due to short rope service life.
- Increased maintenance costs of hoist components such as friction liners due to the wrong choice of rope.
- Increased MRT costs due to unpredictable rope deterioration process.

# TECHNOLOGY - THE BASE FOR FLAWLESS PERFORMANCE

In manufacturing, research & development, as well as marketing & sales, Teufelberger-Redaelli focuses exclusively on high quality special purpose steel wire ropes. Breakthrough technologies and top quality products are our fundamental foundation for a long-lasting and successful relationship. The following short summary provides a glimpse into our deep knowledge and understanding of high performance wire ropes.

## PLASTIFILL® INSERT

The lubricated steel core is covered in a tight synthetic coat. This provides the following advantages:

- Long service life due to permanent lubrication within the rope and the reduced friction between the rope core and the outer strands
- Resistance to compression, crushing and lateral pressure as well as to external environmental influences and the entry of dirt.
- Higher breaking forces due to reduced contact stress occurring within the rope
- Reduced internal abrasion as a result of the exact positioning of strands providing a consistent, engineered clearance between each strand

## SUPERFILL® COMPACTION TECHNOLOGY

Each rope strand is compacted in a proprietary process, which significantly improves the rope properties:

- Up to 30 % greater breaking forces than non-compacted ropes
- Prolonged service life due to lower specific load
- Less abrasion on the rope, reels and drums due to the rope's smooth outer surface
- Resistance against crushing in multilayer operations

## GALVANIZED WIRES

Our steel wires are galvanized before they are drawn to achieve high wire dimensional precision. This ensures optimal stability and service life. In combination with the PLASTIFILL® technology, this galvanization ensures exceptional corrosion resistance.

## ACTIVE CORE LUBRICATION

Temperature resistant special grease with significantly improved lubrication properties:

- Higher resistance against corrosion of the core
- Improved service life due to optimal lubrication and the reduction of friction within the rope core and wires

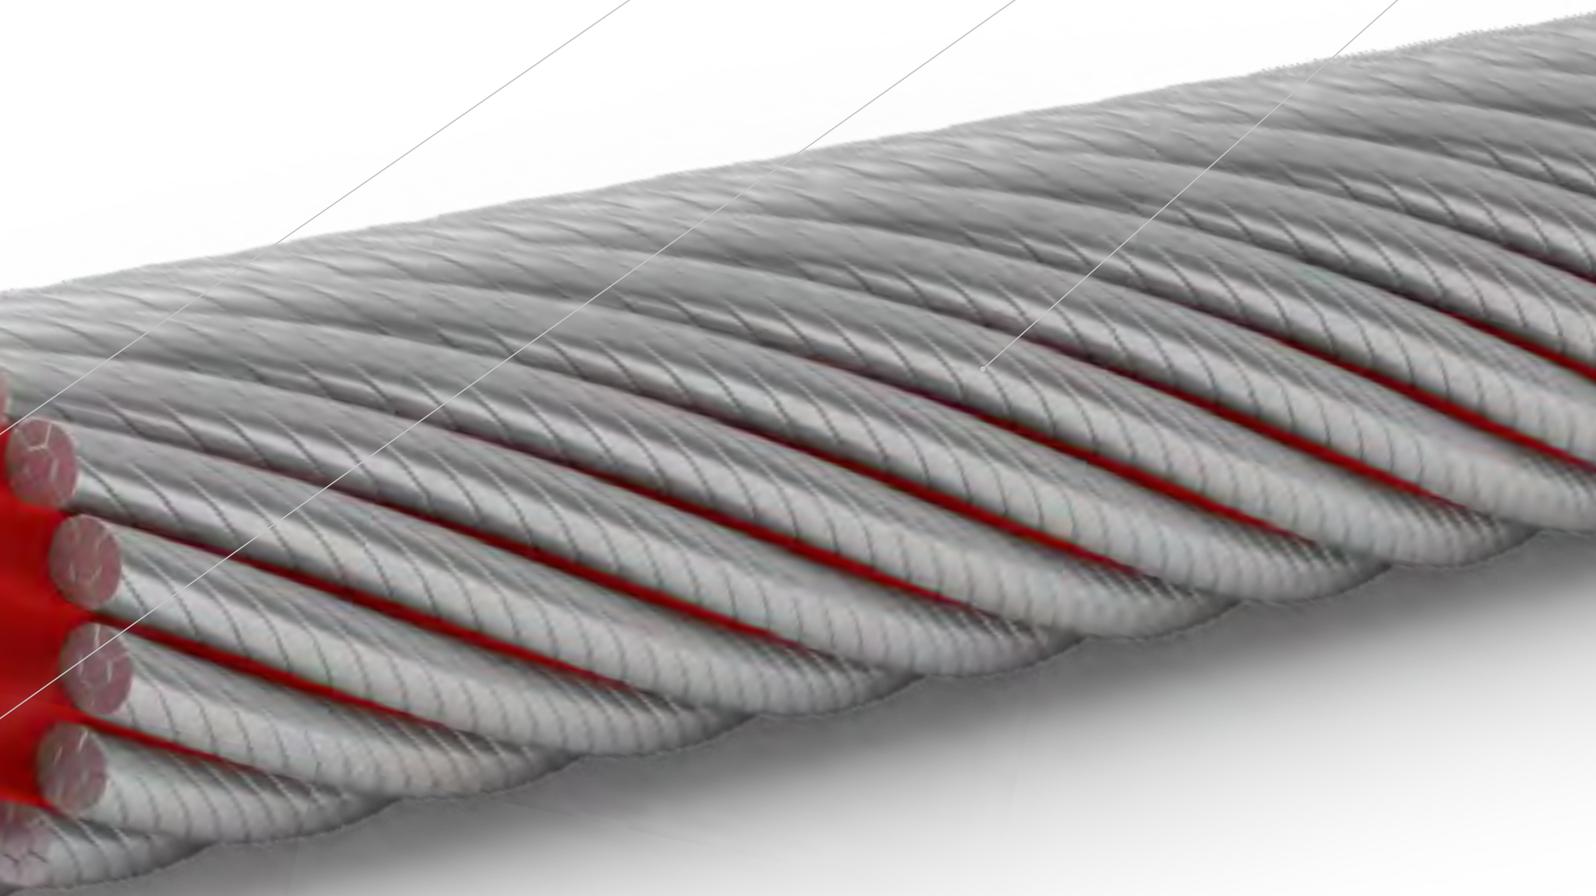

# Our technology. Your benefit.

Long service life, flexibility, high quality, perfect spooling, rotation resistance, high breaking force, safe and reliable in use.

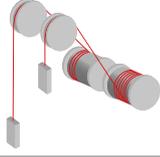

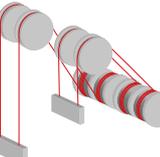

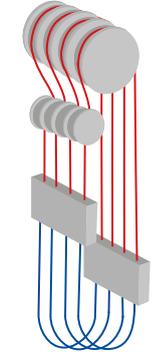

GALVANIZED WIRES

# 7MINE®

The proven 7-strand rope designed to replace conventional triangular strand ropes without changing existing hoisting performance parameters (custom fit). Compacted outer strands with Teufelberger-Redaelli SUPERFILL® compaction technology and our compound core ensure high resistance against drum crushing and the best-in-class weight to breaking strength ratio.

## THE ULTIMATE ALTERNATIVE TO THE TRIANGULAR STRAND ROPE

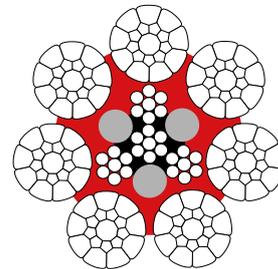

### Specifications

- Lang lay or ordinary lay, right or left lay
- 22 – 48 mm: 7xK19S-EPIWRC (compound)
- 49 – 55 mm: 7xK26WS-EPIWRC (compound)
- 56 – 59 mm: 7xK31WS-EPIWRC (compound)
- Optional: 7xK19S (with built-up center)-EPIWRC (compound)
- Conformity: EN 12385-6 (other standards available upon request)
- Use without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✓ SUPERFILL®
- ✓ PLASTIFILL®

### Benefits

- Non-rotation resistant rope  
(builds up significantly less torque than triangular strand ropes)
- Good breaking force
- High resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Low rope elongation
- Good radial stability
- Good shock resistance
- Excellent rope for ultra-deep shaft mining

\* Actual rope weight = nominal rope weight -2% +5%. Shown nominal rope weight for fully lubricated rope. The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.

# 7MINE<sup>®</sup> HD

The proven 7-strand design is extremely resistant to negative external influences. All strands are compacted using Teufelberger-Redaelli SUPERFILL<sup>®</sup> compaction technology. With its PLASTFILL<sup>®</sup> insert, the rope is extremely stable against lateral pressure.

## WHEN BREAKING FORCE MATTERS MOST

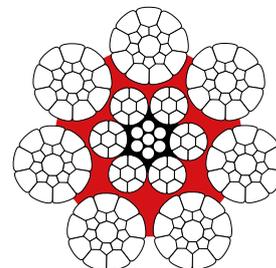

### Specifications

- Lang lay or ordinary lay, right or left lay
- 19 – 48 mm: 7xK19S-EPIWRC(K)
- 49 – 55 mm: 7xK26WS-EPIWRC(K)
- 56 – 65 mm: 7xK31WS-EPIWRC(K)
- Conformity: EN 12385-6 (other standards available upon request)
- Use without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✓ SUPERFILL<sup>®</sup>
- ✓ PLASTFILL<sup>®</sup>

### Benefits

- Non-rotation resistant rope
- High breaking force
- High resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Very low rope elongation
- High radial stability
- Good shock resistance

# 8MINE

An 8-strand rope designed to replace conventional triangular strand ropes without changing existing hoisting performance parameters (custom fit). Compacted outer strands with Teufelberger-Redaelli SUPERFILL® compaction technology and our unique core ensure good resistance against drum crushing and the best-in-class weight to breaking strength ratio.

## ENDURANCE IS EVERYTHING

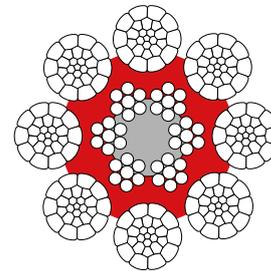

### Specifications

- Lang lay or ordinary lay, right or left lay
- 20 – 30 mm: 8xK19S-EPIWRC
- 31 – 48 mm: 8xK26WS-EPIWRC
- 49 – 59 mm: 8xK31WS-EPIWRC
- 60 – 65 mm: 8xK36WS-EPIWRC
- Conformity: EN 12385-6 (other standards available upon request)
- Use without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✓ SUPERFILL®
- ✓ PLASTFILL®

### Benefits

- Non-rotation resistant rope  
(builds up significantly less torque than triangular strand ropes)
- Good breaking force
- Good resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Low rope elongation
- Good radial stability
- Good shock resistance

\* Actual rope weight = nominal rope weight -2% +5%. Shown nominal rope weight for fully lubricated rope. The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.

# 12MINE 400(P)

12-strand rotation resistant rope with optional PLASTFILL® insert between the steel core and the outer strands. A high performance hoist rope for Koepe friction winders and single layer drum winders when rope elongation, rope twist and bending fatigue matter.

## ROTATION RESISTANCE WITH LESS WEIGHT

### Specifications

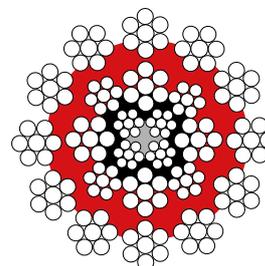

- Lang lay or ordinary lay, right and left lay
- 19 – 65 mm: 12x7-EPIWRC (or IWRC)
- Conformity: EN 12385-6 (other standards available upon request)
- Use with or without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

✘ SUPERFILL®

✔ PLASTFILL®

### Benefits

- Rotation resistant
- Good breaking force
- Good flexibility and bending fatigue performance
- Low rope elongation
- High radial stability
- Improved shock resistance with PLASTFILL®

\* Actual rope weight = nominal rope weight -2% +5%. Shown nominal rope weight for fully lubricated rope.  
The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.

# 12MINE 440(P)

12-strand rotation resistant rope with optional PLASTFILL® insert between the steel core and the outer strands. Compacted outer strands with Teufelberger-Redaelli SUPERFILL® compaction technology make the rope wear resistant and ideal for multi-layer drum winders but also suitable for single layer drum and Koepe friction winders.

## WEAR AND ROTATION RESISTANCE WITH LESS WEIGHT

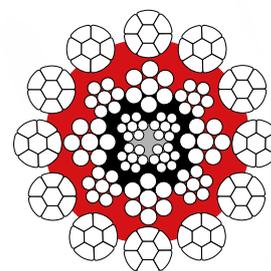

### Specifications

- Lang lay or ordinary lay, right and left lay
- 19 – 65 mm: 12xK7-EPIWRC (or IWRC)
- Conformity: EN 12385-6 (other standards available upon request)
- Use with or without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✓ SUPERFILL®
- ✓ PLASTFILL®

### Benefits

- Rotation resistant
- Good breaking force
- High resistance to wear and drum crushing
- Good flexibility and bending fatigue performance
- Low rope elongation
- High radial stability
- Improved shock resistance with PLASTFILL®

\* Actual rope weight = nominal rope weight -2% +5%. Shown nominal rope weight for fully lubricated rope.  
The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.

# 12MINE 460(P)

12-strand rotation resistant rope with optional PLASTFILL® insert between the steel core and the outer strands. All strands are compacted using Teufelberger-Redaelli SUPERFILL® compaction technology, which significantly increases the rope's wear resistance and breaking force. Suitable for use with friction and drum winders.

## BEST STRENGTH TO WEIGHT RATIO

### Specifications

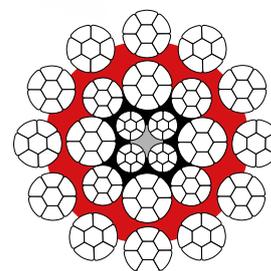

- Lang lay or ordinary lay, right and left lay
- 19 – 65 mm: 12xK7-EPIWRC(K) (or IWRC(K))
- Conformity: EN 12385-6 (other standards available upon request)
- Use with or without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

✓ SUPERFILL®

✓ PLASTFILL®

### Benefits

- Rotation resistant
- High breaking force
- High resistance to wear and drum crushing
- Good flexibility and bending fatigue performance
- Low rope elongation
- High radial stability
- Improved shock resistance with PLASTFILL®

# FLEXMINE® 400(P)

15-strand rotation resistant hoist rope with optional PLASTFILL® insert between the steel core and the outer strands. A high performance hoist rope for Koepe friction winders and single-layer drum winders when rope elongation, twist and bending fatigue matter.

## ROTATION RESISTANT HIGH PERFORMER

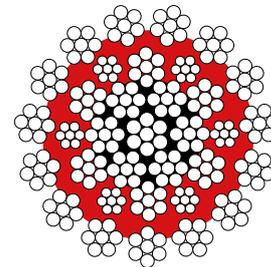

### Specifications

- Lang lay or ordinary lay, right and left lay
- 19 – 65 mm: 15x7-EPIWRC (or IWRC)
- Conformity: EN 12385-6 (22-65 mm) / EN 12385-4 (19-21 mm) (other standards available upon request)
- Use with or without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✘ SUPERFILL®
- ✔ PLASTFILL®

### Benefits

- Rotation resistant
- Good breaking force
- High flexibility and bending fatigue performance
- Very low rope elongation
- Excellent radial stability
- Improved shock resistance with PLASTFILL®

# FLEXMINE® 440(P)

15-strand rotation resistant rope with optional PLASTFILL® insert between the steel core and the outer strands. Compacted outer strands with Teufelberger-Redaelli SUPERFILL® compaction technology make the rope wear resistant and ideal for multi-layer drum winders but also suitable for single-layer drum and Koepe friction winders.

## ROTATION AND WEAR RESISTANT HIGH PERFORMER

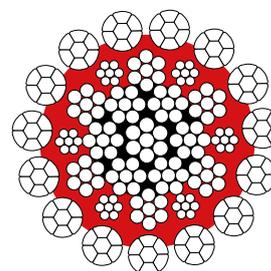

### Specifications

- Lang lay or ordinary lay, right and left lay
- 19 – 65 mm: 15xK7-EPIWRC (or IWRC)
- Conformity: EN 12385-6 (22-65 mm) / EN 12385-4 (19-21 mm) (other standards available upon request)
- Use with or without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✓ SUPERFILL®
- ✓ PLASTFILL®

### Benefits

- Rotation resistant
- Good breaking force
- High resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Very low rope elongation
- Excellent radial stability
- Improved shock resistance with PLASTFILL®

\* Actual rope weight = nominal rope weight -2% +5%. Shown nominal rope weight for fully lubricated rope. The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.

# FLEXMINE® 460(P)

15-strand rotation resistant rope with optional PLASTFILL® insert between the steel core and the outer strands. All strands are compacted using Teufelberger-Redaelli SUPERFILL® compaction technology, which significantly increases the rope's wear resistance and breaking force. Suitable for use with friction and drum winders.

## ROTATION AND WEAR RESISTANT HIGH PERFORMER WITH INCREASED STRENGTH

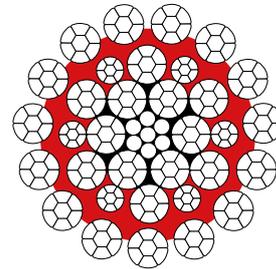

### Specifications

- Lang lay or ordinary lay, right and left lay
- 19 – 65 mm: 15xK7-EPIWRC(K) (or IWRC(K))
- Conformity: EN 12385-6 (20-65 mm) / EN 12385-4 (19 mm) (other standards available upon request)
- Use with or without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✓ SUPERFILL®
- ✓ PLASTFILL®

### Benefits

- Rotation resistant
- High breaking force
- High resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Very low rope elongation
- Excellent radial stability
- Improved shock resistance with PLASTFILL®

\* Actual rope weight = nominal rope weight -2% +5%. Shown nominal rope weight for fully lubricated rope.  
The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.

# FLEXPACK® MINING(P)

Best-in-class 35x7 rotation resistant rope for use in a vast variety of heavy duty underground mining applications in challenging environments.

## BEST-IN-CLASS 35X7 HEAVY DUTY WIRE ROPE

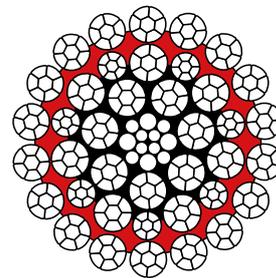

### Specifications

- Lang lay or ordinary lay, right and left lay
- 19 – 40 mm: 15xK7-EPIWRC(K) (or IWRC(K))
- 41 – 65 mm: 18xK7-EPIWRC(K) (or IWRC(K))
- Conformity: EN 12385-6  
(other standards available upon request)
- Use with or without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✓ SUPERFILL®
- ✓ PLASTFILL®

### Benefits

- Rotation resistant
- Very high breaking force
- Very high resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Very low rope elongation
- Excellent radial stability
- Improved shock resistance with PLASTFILL®

# EXTRAFLEX EVO

Rotation resistant full-locked coil high performance hoist rope for drum and Koepe friction winder hoists. Our vast and long-standing experience in the development and production of full-locked coil ropes empowers us to offer this rope to the underground mining industry.

## SIMPLY STRONG

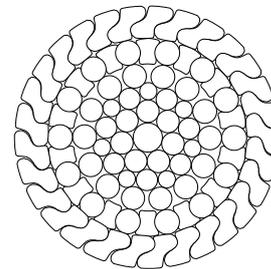

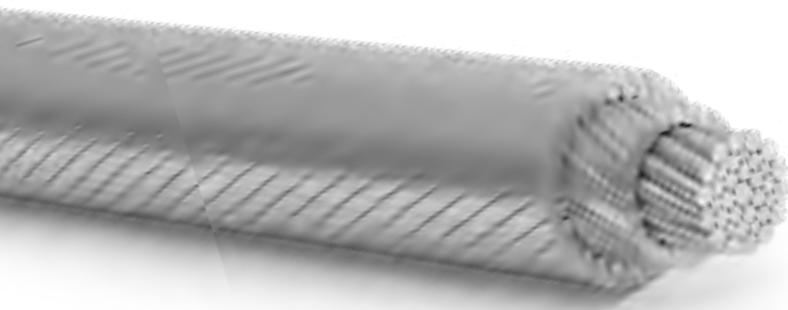

### Specifications

- Right or left lay
- 22 – 38 mm
- Conformity: EN 12385-7 (other standards available upon request)
- Use with or without rope swivel
- Rope finish: bright, galvanized, ZnAl

- × SUPERFILL®
- × PLASTFILL®

### Benefits

- Rotation resistant
- High breaking force
- High resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Very low rope elongation
- Excellent radial stability

Technical rope parameters upon request.

# IPERFLEX®

18-strand rotation resistant balance rope for Koepe friction winders, featuring excellent flexibility, high bending fatigue performance and outstanding torque balance.

## FLEXIBILITY COMBINED WITH EXCELLENT ROTATIONAL PROPERTIES

### Specifications

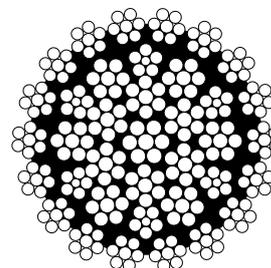

- Lang lay or ordinary lay, right and left lay
- 30 – 58 mm: 18x7-IWRC
- Conformity: EN 12385-6 (other standards available upon request)
- Use with rope swivel
- Rope finish: bright, galvanized class B, ZnAl

× SUPERFILL®

× PLASTFILL®

### Benefits

- Rotation resistant
- Good breaking force
- High flexibility and bending fatigue performance
- Very low rope elongation
- Excellent radial stability

# I PERFLEX® H

18-strand rotation resistant balance rope for Koepe friction winders, featuring excellent flexibility, high bending fatigue performance, outstanding torque balance and increased rope weight.

## FLEXIBILITY AND EXCELLENT ROTATIONAL STABILITY WITH INCREASED WEIGHT

### Specifications

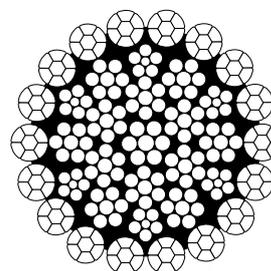

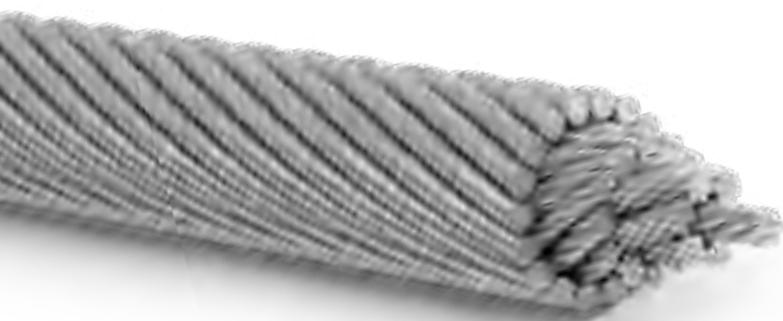

- Lang lay or ordinary lay, right and left lay
- 30 – 58 mm: 18xK7-IWRC
- Conformity: EN 12385-6 (other standards available upon request)
- Use with rope swivel
- Rope finish: bright, galvanized class B, ZnAl

✓ SUPERFILL®

✗ PLASTFILL®

### Benefits

- Rotation resistant
- High breaking force
- High flexibility and bending fatigue performance
- Very low rope elongation
- Excellent radial stability
- “H” for increased rope weight due to compacted outer strands

# IPERFLEX® L

18-strand rotation resistant balance rope for Koepe friction winders, featuring excellent flexibility, high bending fatigue performance, outstanding torque balance and reduced rope weight.

## FLEXIBILITY AND EXCELLENT ROTATIONAL STABILITY WITH REDUCED WEIGHT

### Specifications

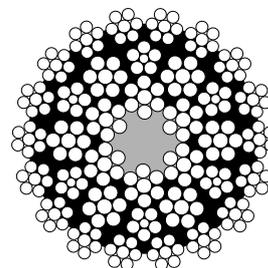

- Lang lay or ordinary lay, right and left lay
- 30 – 58 mm: 18x7-IWRC-SFC
- Conformity: EN 12385-6 (other standards available upon request)
- Use with rope swivel
- Rope finish: bright, galvanized class B, ZnAl

× SUPERFILL®

× PLASTFILL®

### Benefits

- Rotation resistant
- Good breaking force
- High flexibility and bending fatigue performance
- Low rope elongation
- Excellent radial stability
- “L” for reduced rope weight due to a synthetic fiber strand as center strand

# FLEXGUIDE HLC

Rotation resistant half-locked coil premium high performance guide rope. Our half-locked coil guide ropes are optimized to ensure a long service life, easier handling during installation, and reduced maintenance.

## THE ROBUST DURABLE GUIDE ROPE SOLUTION

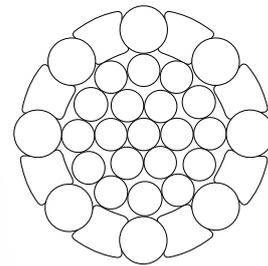

### Specifications

- Right or left lay
- 31.75 – 56 mm
- Conformity: EN 12385-7 (other standards available upon request)
- Rope finish: bright, galvanized, ZnAl

- ✗ SUPERFILL®
- ✗ PLASTFILL®

### Benefits

- Rotation resistant
- High breaking force
- High resistance to wear
- Optimized round and shaped wires for long service life
- Very low rope elongation
- Excellent radial stability

\* Actual rope weight = nominal rope weight -4% +4%. Shown nominal rope weight for fully lubricated rope. The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.  
 \*\*The first grade refers to inner wires, the second grade refers to outer-layer wires.

# 6MINE

The proven 6-strand rope which can replace conventional triangular strand ropes. Mainly used on Koepe friction winders and single-layer drum winders. The rope features compacted outer strands with Teufelberger-Redaelli SUPERFILL® compaction technology and our unique compound core.

## COMPOUND CORE AND HIGH FLEXIBILITY

### Specifications

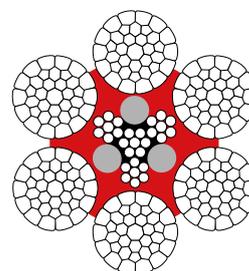

- Lang lay or ordinary lay, right and left lay
- 21 – 23 mm: 6xK19S-EPIWRC (compound)
- 24 – 32 mm: 6xK26WS-EPIWRC (compound)
- 33 – 38 mm: 6xK31WS-EPIWRC (compound)
- 39 – 65 mm: 6xK36WS-EPIWRC (compound)
- Conformity: EN 12385-6 (other standards available upon request)
- Use without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

✓ SUPERFILL®

✓ PLASTFILL®

### Benefits

- Non-rotation resistant rope (builds up significantly less torque than triangular strand ropes)
- Good breaking force
- Medium resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Medium rope elongation
- Good radial stability
- Good shock resistance

# RED 1T

Premium reliable 6-strand rope with non-compacted outer strands and a synthetic fiber core. Mainly used on Koepe friction winders and single-layer drum winders.

## NON-COMPACTED & LIGHTWEIGHT

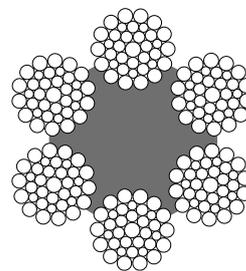

### Specifications

- Lang lay or ordinary lay, right and left lay
- 20 – 26 mm: 6x19S-SFC
- 27 – 30 mm: 6x31WS-SFC
- 31 – 60 mm: 6x36WS-SFC
- Conformity: EN 12385-6 (other standards available upon request)
- Use without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✗ SUPERFILL®
- ✗ PLASTFILL®

### Benefits

- Non-rotation resistant rope
- Medium breaking force
- High flexibility and bending fatigue performance
- Medium rope elongation
- Medium radial stability
- Good shock resistance

# PACK<sup>®</sup> 1T

Premium reliable 6-strand rope consisting of compacted outer strands with Teufelberger-Redaelli SUPERFILL<sup>®</sup> compaction technology and a synthetic fiber core. Mainly used on Koepe friction winders and single-layer drum winders.

## COMPACTED & LIGHTWEIGHT

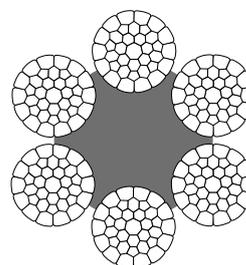

### Specifications

- Lang lay or ordinary lay, right and left lay
- 20 – 23 mm: 6xK19S-SFC
- 24 – 30 mm: 6xK31WS-SFC
- 31 – 60 mm: 6xK36WS-SFC
- Conformity: EN 12385-6 (other standards available upon request)
- Use without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

- ✓ SUPERFILL<sup>®</sup>
- ✗ PLASTFILL<sup>®</sup>

### Benefits

- Non-rotation resistant rope
- Good breaking force
- Medium resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Medium rope elongation
- Medium radial stability
- Good shock resistance

\* Actual rope weight = nominal rope weight -2% +5%. Shown nominal rope weight for strand lubricated rope. The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.

# RED 1

Premium reliable 6-strand rope with non-compacted outer strands and a non-compacted independent wire rope core. Mainly used on Koepe friction winders and single-layer drum winders.

## FIT FOR PURPOSE

### Specifications

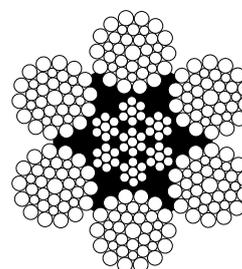

- Lang lay or ordinary lay, right and left lay
- 19 – 26 mm: 6x19S-IWRC
- 27 – 32 mm: 6x26WS-IWRC
- 33 – 38 mm: 6x31WS-IWRC
- 39 – 65 mm: 6x36WS-IWRC
- Conformity: EN 12385-6 (other standards available upon request)
- Use without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

✗ SUPERFILL®

✗ PLASTFILL®

### Benefits

- Non-rotation resistant rope
- Good breaking force
- Medium resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Low rope elongation
- Good radial stability

\* Actual rope weight = nominal rope weight -2% +5%. Shown nominal rope weight for strand lubricated rope. The table is for reference only. Additional rope diameters upon request. All ropes can be customized to specific applications.

# PACK<sup>®</sup> 1

Premium reliable 6-strand rope consisting of compacted outer strands with Teufelberger-Redaelli SUPERFILL<sup>®</sup> compaction technology and a non-compacted independent wire rope core. Mainly used on Koepe friction winders and single-layer drum winders.

## FIT FOR PURPOSE WITH INCREASED STRENGTH

### Specifications

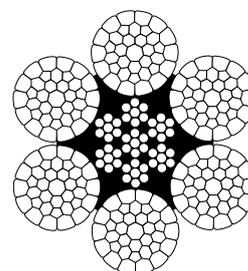

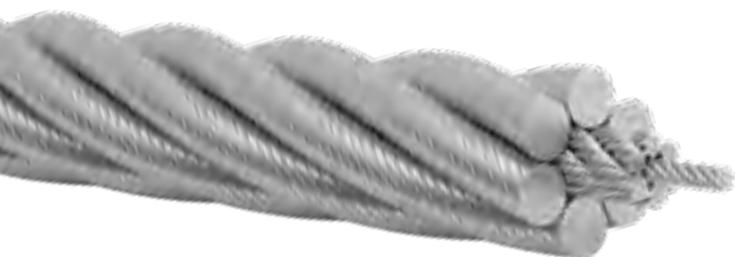

- Lang lay or ordinary lay, right and left lay
- 19 – 23 mm: 6xK19S-IWRC
- 24 – 32 mm: 6xK26WS-IWRC
- 33 – 38 mm: 6xK31WS-IWRC
- 39 – 65 mm: 6xK36WS-IWRC
- Conformity: EN 12385-6 (other standards available upon request)
- Use without rope swivel
- Rope finish: bright, galvanized class B, ZnAl

✓ SUPERFILL<sup>®</sup>

✗ PLASTFILL<sup>®</sup>

### Benefits

- Non-rotation resistant rope
- High breaking force
- Medium resistance to wear and drum crushing
- High flexibility and bending fatigue performance
- Low rope elongation
- Good radial stability

# TECHNICAL SECTION

## STEEL WIRE ROPE

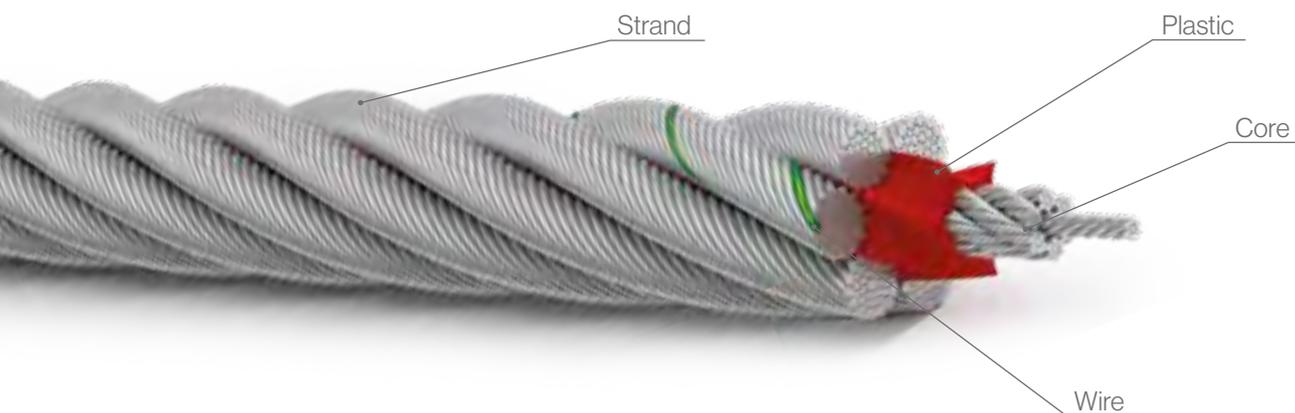

A steel wire rope is a complex mechanical (machine) component (in motion) that transmits force along its axis. It is made up of individual steel wires laid into strands. A number of strands are laid around a central core, thus forming a rope.

The main component of steel wire ropes is carbon steel which can be coated with zinc or a zinc alloy, e.g., Zn95/Al5. Besides the outer strands, the other components of a typical steel wire rope are the core which may also be of carbon steel, or else of synthetic fiber; the rope lubricant(s); and any internal filling or external covering, where applicable.

### Making of wire ropes (simplified illustration)

### Elements of a wire rope

## Core

The three types of cores commonly used in wire ropes are:

- \* Independent wire rope cores (IWRC),
- \* Wire strand cores (WSC),
- \* Fiber cores (FC), mainly synthetic fiber cores (SFC).

The right choice of core largely depends on the specific application that the rope is intended for.

> The primary function of the core is to provide support to the outer layer strands. Additionally, fiber cores can store a significant amount of lubricant (lubrication function).

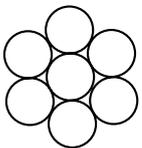

## Strands

The wires are the main components of a wire rope. In case of stranded ropes, the wires are laid into strands (stranding) and the strands are subsequently laid into a rope (closing).

## Strand designs

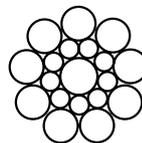

(Reference standard: EN 12385-2)

General rule: A rope with strands made up of a few large wires will be more abrasion resistant and less fatigue resistant than a rope of the same size made up of strands with many wires.

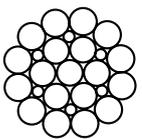

### Single lay strand (1-6) = 7

This strand consists of a single-wire center with an outer layer of wires laid around it. All wires in the outer layer have the same diameter (usually different from the center wire).

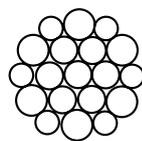

### Seale (1-9-9) = 19S

Two layers of wires around a center wire. All wires in each layer are of the same diameter. The strand is designed in such a way that the large outer wires rest in the valleys between the smaller inner wires (parallel lay strand).

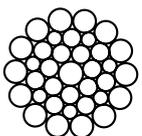

### Filler (1-6-6F-12) = 25F

Two layers of uniformly sized wires around a center wire with the inner layer having half the wires as the outer layer. Small filler wires, equal in number to the inner layer, are laid in the valleys of the inner layer (parallel lay strand). Note: The strength of the filler wires is not considered for the minimum breaking force.

### Warrington (1-6-6+6) = 19W

Two layers of wires around a center wire with wires of one diameter in the inner layer, and wires of a smaller diameter alternating with wires of a larger diameter in the outer layer. The larger outer wires rest in the valleys, and the smaller ones on the crowns of the inner lay (parallel lay strand).

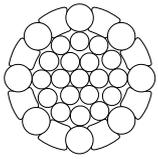

### Warrington-Seale (1-7-7+7-14) = 36WS

A combination of the above-described Warrington and Seale constructions.

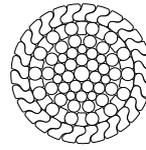

## Half- and full-locked coil ropes

(Reference standard: EN 12385-2)

### Half-locked coil (HLC)

Spiral rope with an outer layer of alternating round and H-shaped wires. Ideal as guide rope.

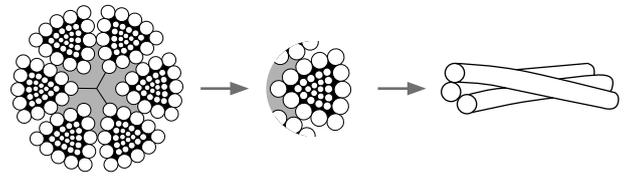

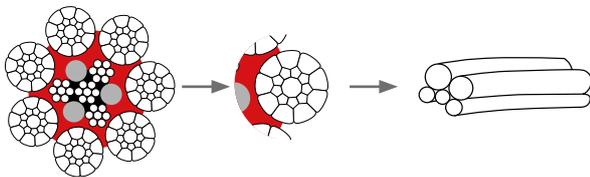

### Full-locked coil (FLC)

Spiral rope with an outer layer of Z-shaped wires  
 Note: The rope can have several Z-shaped wire layers or one outer layer of Z-shaped wires and underneath it a layer of alternating round and H-shaped wires, depending on the application and the rope.

## Parallel lay strands versus cross lay strands

Round strand ropes are made up of parallel lay strands whereas triangular strand ropes are made up of cross lay strands.

Parallel lay strands	Cross lay strands
The outer wires have the same lay length as the inner wires, which results in line contact between the wires within a strand and, consequently, low contact stress, no secondary bending, no internal wire nicking and wear.	The wire layers cross over one another and make point contact. This leads to high internal contact stress, secondary bending, internal wire nicking and wear.
High bending fatigue performance	Reduced bending fatigue performance
Ropes with parallel lay strands build up less torque and turn less often during a torque release (safer and easier handling)	Ropes with cross lay strands build up more torque and turn more often during a torque release
Parallel strands can be compacted	Triangular strands should not be compacted

All our stranded mining ropes are made up of parallel lay strands.

## Lay directions and lay types of wire ropes

Depending on the direction of the outer strands, a rope is classified as either a right hand or a left hand rope. Additionally, depending on the lay direction of the wires in a strand, the rope is classified as either a regular lay or a lang lay rope. The lay direction of the wires in the strand is indicated first (lowercase letter), followed by the lay of the strands in the wire rope (capital letter).

Right hand regular lay (sZ)

Left hand regular lay (zS)

Right hand lang lay (zZ)

Left hand lang lay (sS)

⚠ Regular lay ropes are also called ordinary lay ropes.

## Lang lay versus regular lay ropes

Lang lay rope (same direction of lay of strand and wires of outer strand)	Regular lay rope (opposite direction of lay of strand and wires of outer strand)
Increased flexibility	Reduced flexibility
Increased bending fatigue performance	Reduced bending fatigue performance
Increased resistance to wear and crushing due to a more even outer surface and improved contact points (line contact)	Reduced resistance to wear and crushing due to rougher outer surface and more point-to-point contact
Slightly reduced rotational stability and slightly more torque buildup in operation	Slightly better rotational stability and slightly less torque buildup in operation
	

The most common lay type currently used in mining is the lang lay, as this lay type typically generates a longer rope service life (especially when used on multi-layer drum winders). The slightly higher torque factor of lang lay ropes and the slightly higher sensitivity against twisting can be kept to a minimum by means of a special rope closing process during production.

**⚠** Lang lay ropes must be subject to regular electromagnetic rope inspections, especially when used on single-layer rope applications. Local mining regulations must be complied with.

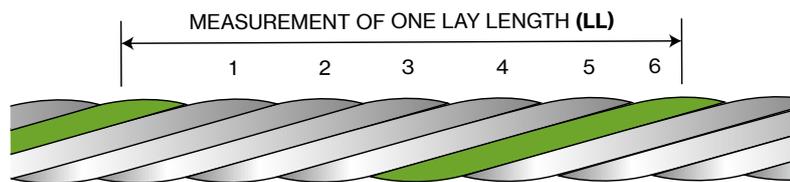

## Lay length of a wire rope

That distance parallel to the longitudinal rope axis in which the outer wires of a spiral rope or the outer strands of a stranded rope make one complete turn (or helix) around the rope axis.

$LL = (\text{lay length of the rope}) = \text{nominal rope diameter} * \text{lay length factor "LLF"}$

LLF = multiple of nominal rope diameter (typical values for LLF: from 6 to 9)

A short lay length makes the rope more flexible. On the other hand, such a rope elongates more (spring effect).

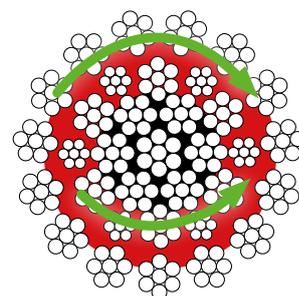

Example of an LL measurement on a 6-strand rope

## Rotational stability of a wire rope

### Rotation resistant and non-rotation resistant ropes

In general, any kind of rope component, i.e., wire or strand, which is laid in a helical shape around a core has a tendency to unlay under load and generates torque if rotation is prevented. This behavior is determined by the design of the rope and the combination of various rope properties. The strongest tendency to rotate can be found in single-layer ropes; especially in lang lay type ropes, where the torque buildup within the rope is slightly increased due to the fact that the wires and the strands are twisted in the same direction. Multi-strand ropes like 12-, 15- and 18-strand ropes are all rotation-resistant and have at least two layers of strands laid helically around a core. The direction of the outer strands is opposite to that of the underlying strand layers. Such ropes are low- or nearly non-rotating because the torque of the outer strands and the torque of the core strands balance each other out (metallic area of outer strands is similar to metallic area of core strands).

According to the definition of FEYRER (University of Stuttgart), a rope can be considered as rotation-resistant if it has a rotational property less than or equal to 1 turn on a length corresponding to 1000 times the nominal rope diameter when a force of approx. 15-20% of the MBF is applied.

Rope	Category	Torque factor (c1*) at 20% of MBF lang lay	Torque factor (c1*) at 20% of MBF regular lay
RED1T	Non-rotation resistant	0.17	0.12
PACK1T	Non-rotation resistant	0.17	0.12
RED1	Non-rotation resistant	0.13	0.09
PACK1	Non-rotation resistant	0.13	0.08
6MINE	Non-rotation resistant	0.13	0.08
7MINE	Non-rotation resistant	0.13	0.10
7MINE HD	Non-rotation resistant	0.13	0.10
8MINE	Non-rotation resistant	0.14	0.11
12MINE 400(P), 12MINE 440(P), 12MINE 460(P)	Rotation resistant	0.07	0.06
FLEXMINE 400(P), FLEXMINE 440(P), FLEXMINE 460(P)	Rotation resistant	0.04	0.03
FLEXPACK MINING (P) with 15 outer strands	Rotation resistant	0.04	0.03
FLEXPACK MINING (P) with 18 outer strands	Rotation resistant	0.02	0.02
IPERFLEX, IPERFLEX L, IPERFLEX H	Rotation resistant	0.03	0.02
Rope	Category	Torque factor (c1*) at 20% of MBF for spiral ropes	
FLEXGUIDE HLC	Rotation resistant	0.06	

\* indicated "c1" values are calculated values and may defer from actual values

**⚠** For single-fall unguided lifting operations or ropes used in connection with swivels, only rotation resistant ropes are to be used (e.g., shaft sinking projects, balance ropes, etc.). Rotation resistant ropes are also the preferred choice for support ropes (pilot ropes) used in rope installations.

**Teufelberger-Redaelli recommendation**

Rotation resistant ropes have a low torque value and a low elongation but are more sensitive to external influences caused by the system, e.g., fleet angles, shock loads, etc., and are therefore exposed to a higher risk of failing due to basket and cork screw deformations and loose strands. Please contact your nearest Teufelberger-Redaelli Technical Sales Consultant ([wirope@teufelberger.com](mailto:wirope@teufelberger.com)) for further advice on whether or not a rotation resistant rope shall be used in your case.

## Principal characteristics of a wire rope

The elements of a wire rope are arranged in a helical shape to achieve the rope's principal characteristics. The behavior of steel wire ropes depends on some specific technical characteristics that can be summarized as below:

• **Rotational stability**

Ropes can be built with rotational or anti-rotational behavior. Anti-rotational behavior is, e.g., mandatory for unguided single-fall applications.

• **Radial stiffness (resistance to transverse pressure)**

Radial stiffness is an essential characteristic in many rope applications, for example on multi-layer drum winders, where the rope is subjected at simultaneously to the pulling force and the compression caused by the upper layers.

• **Resistance to wear**

Big compacted outer wires if required by the application, e.g., on multi-layer drum winders.

• **Flexibility / bending fatigue performance**

Thin wires adapted to small diameter ratios (D/d). Important where bending fatigue is the main reason for rope discard (e.g., single-layer drum winders, friction winders).

• **Shock resistance / resistance to dynamic stress**

Capacity of the wire rope to absorb shock loads without suffering from permanent deformation or geometrical decomposition (e.g., during loading and unloading of skip). Ability to handle dynamic stress during acceleration and deceleration.

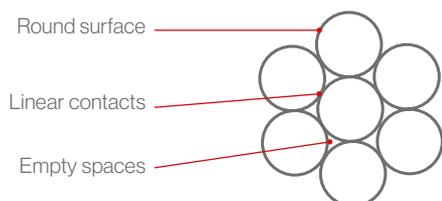

## TEUFELBERGER-REDAELLI TECHNOLOGY

### Compacted strands / “SUPERFILL® Compaction Technology”

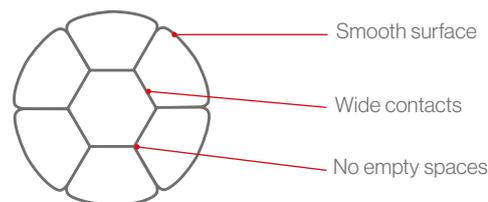

Strand compaction is a cold deformation process of the whole strand and its wires, achieved by the passage of the strand through a set of rollers (roller compacting).

By means of the compacting process, the following significant modifications of the wire shape are achieved:

- Increasing of strand fill factor → increased breaking force
- Wider contact surface between wires
- Smoother and more wear resistant strand surface
- Better tension distribution within the wires

Non-compacted strand

Compacted strand

Compaction is used to produce ropes with a higher breaking force (due to increased fill factor) which are able to work under higher lateral pressure conditions and where abrasion is a critical issue (due to a higher strand resistance and larger contact surface between wires as well as between the rope and the drum/sheaves).

#### **Teufelberger-Redaelli recommendation**

*It is recommended to use ropes with compacted strands on multi-layer drum and winch applications. Compacted strands also increase the service life of friction liners due to an increased outer strand surface.*

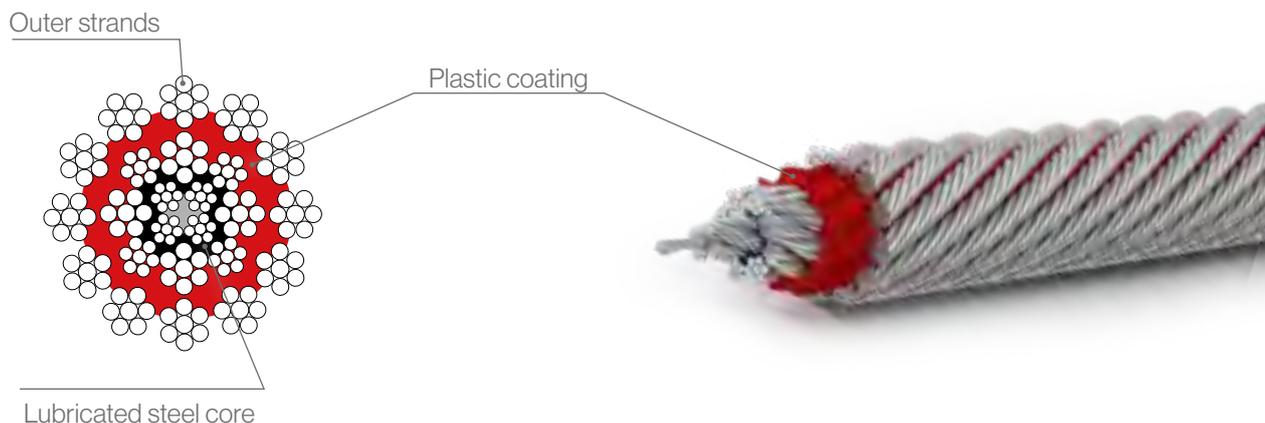

### Plastic-coated core “Plastfill®”

PLASTFILL® is a plastic impregnation technology which adds specific characteristics to the rope with a positive impact on its service life.

Ropes with a plastic-coated core consist of an external layer of strands wound helically around the steel core once the core is coated with a protective plastic layer. Inserting a plastic layer drastically reduces any potential displacement of the various components that cohesively work together, and thus the plastic layer prevents geometric alterations within the rope.

A plastic coated core has the following advantages:

- ✓ Creates a mechanical joint that stabilizes and supports the positions of the individual components of the rope while allowing necessary movement.
- ✓ Drastically reduces internal corrosion processes by restricting the ingress of polluting agents.
- ✓ Filling the free space between exterior strands noticeably prevents friction wear damage.
- ✓ Makes the rope less vulnerable to shock loads, high fleet angles, and high transverse pressure

#### **Teufelberger-Redaelli recommendation**

*It is recommended to use plastic-coated ropes for friction winder hoist ropes and for systems with increased fleet angles. For drum winders, it can be useful to use plastic-coated ropes to increase service life (depending on the system).*

## Wire finish (corrosion protection)

Bright (U):	Uncoated
Galvanized class B:	Zinc coated wires acc. to EN 10264-2 and EN 10264-3 (standard)
Galvanized class A*:	Zinc coated wires acc. to EN 10264-2 and EN 10264-3 (heavy galvanized)
Zn95/Al5:	Zinc 95%-Aluminum 5% alloy coated wires

\* Available only for non-compacted balance ropes and for certain wire diameters.  
 Note: additional wire finish upon request.

## Wire rope manufacturing standards

Our default standards for all our underground mining ropes are the European mining standards EN 12385-6 (stranded ropes) and EN 12385-7 (locked coil ropes). We can produce all our ropes in accordance with other mining rope standards upon request, e.g., CSA-G4, GB 8918, GOST, AS 3569, TAS 6.

### ROPE WEIGHT

All our ropes in this catalog are designed in accordance with the European mining standards EN 12385-6 for round strand ropes and EN 12385-7 for locked coil ropes.

Type of rope	Actual rope weight
Round strand ropes	nominal weight -2% up to +5%
Locked coil ropes	nominal weight -4% up to +4%

Nominal rope weight = rope weight shown in the technical tables | Rope weight can be customized.

### ROPE DIAMETER

All our ropes in this catalog are designed in accordance with the European mining standards EN 12385-6 for round strand ropes and EN 12385-7 for locked coil ropes.

Type of rope	Actual rope diameter
6, 7 and 8-strand fiber core ropes	nominal rope diameter +2% up to +5%
All other round strand ropes	nominal rope diameter -0% up to +5%
Locked coil ropes	nominal rope diameter -2% up to +2%

Nominal rope diameter = rope diameter shown in the technical tables | Rope diameter can be customized.

### WIRE QUALITY

All our ropes in this catalog are in accordance with the European mining standards EN 12385-6 and EN 12385-7 and the high wire quality standards contained therein.

Hoist and guide ropes:	EN 10264-3 + higher quality standards defined by Teufelberger-Redaelli
Balance ropes:	EN 10264-2

### LENGTHS

Nominal length	Tolerance
Up to 400 m (1312 ft)	0% to +5%
Over 400 m (1312 ft) up to 1000 m (3290 ft)	0 m (0 ft) to +20m (+66 ft)
Over 1000 m (3290 ft)	0% to +2%

Tolerances according to EN 12385-1

Ropes required with smaller tolerances, for example, ropes fitted with a termination at each end, upon request.

## CHOOSING THE RIGHT ROPE FOR THE APPLICATION

Unfortunately, the perfect rope does not exist. Therefore, a rope is always a compromise between various properties, with the following factors to be taken into consideration.

- application
- system parameters
- environment in which the rope is used

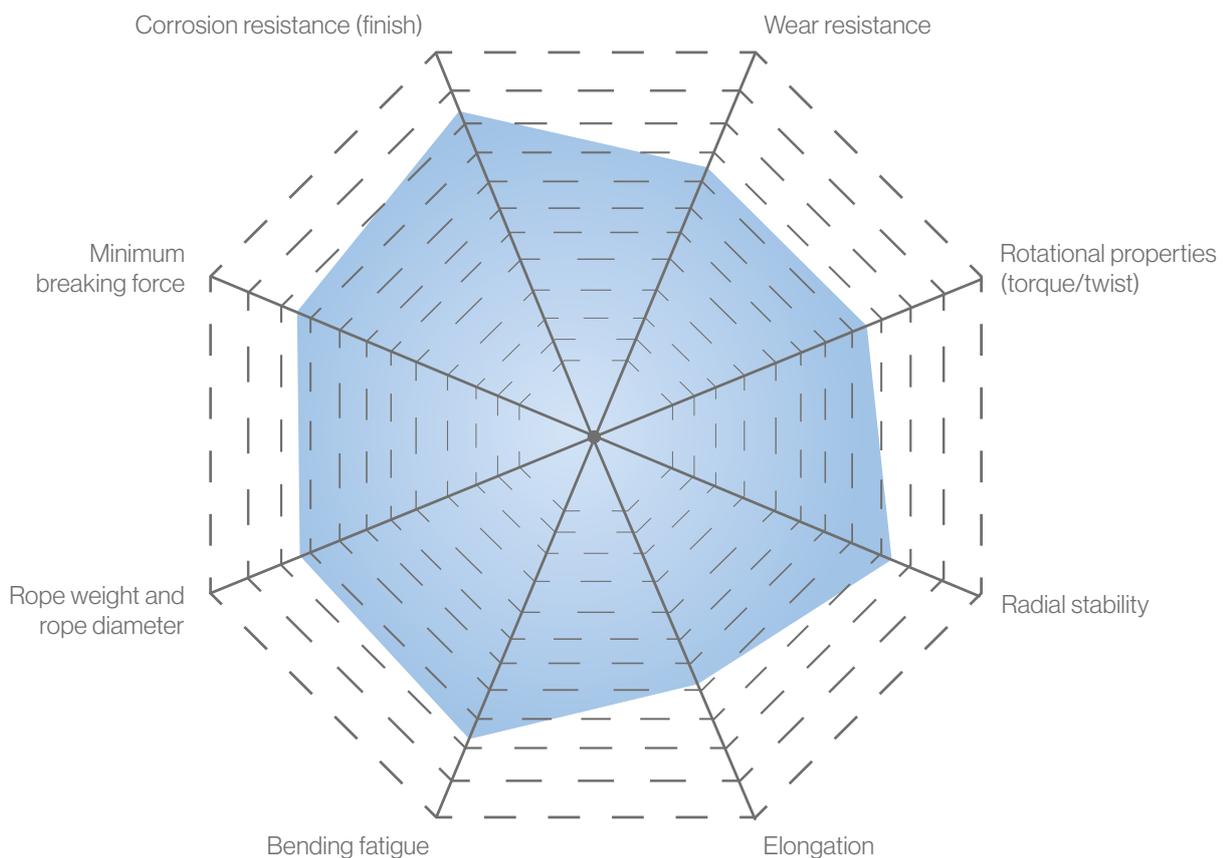

The challenge is to find the best compromise between the various rope properties so that the rope performance is optimized for the specific application and the given environment, resulting in a safe long rope service life and the best possible return on investment (maximum rope service life combined with minimized maintenance and downtime costs).

The blue surface shown below represents the rope service life.

We, together with our customers, maximize the size of the blue surface by adjusting every single rope property keeping your system parameters and environment in mind.

### **Teufelberger-Redaelli recommendation**

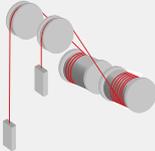

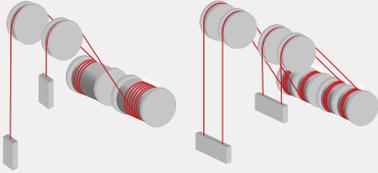

*It is recommended to involve our rope specialists early on in your project (new hoist, hoist upgrade, or shaft sinking project) so we can assist you in choosing the right wire rope solution ([wirerope@teufelberger.com](mailto:wirerope@teufelberger.com)).*

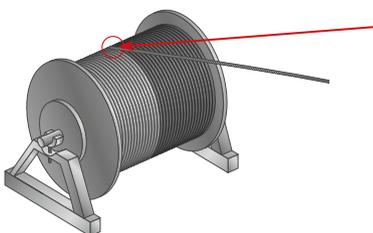

## Hoist ropes

Careful consideration should be taken with regard to the application, the system parameters, maintenance procedures and the environmental influences when considering the most critical and important rope properties required.

The following table shows important rope properties (besides breaking force, rope weight, rope diameter, finish, lubricant, radial stability) to be considered when choosing the ideal hoist rope for a specific application.

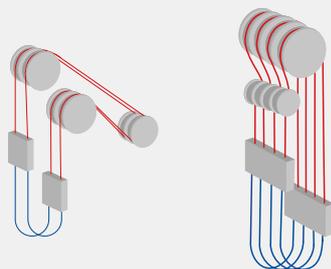

Single layer drum hoist		
		
1. Rope property "High bending fatigue performance"	2. Rope property "Torque/Twist"	3. Rope property "Elongation"
<p>The bending fatigue of a rope can be maximized by opting for:</p> <ol style="list-style-type: none"> <li>1) relatively small wires</li> <li>2) lang lay rope</li> <li>3) parallel lay strands</li> <li>4) low tensile grade wires</li> <li>5) proper lubrication</li> </ol> <p>Note: The strand design of each rope can be customized.</p>	<ol style="list-style-type: none"> <li>1) Shafts deeper than 600 m (1968 ft) with wooden or rope guides (might) require rotation resistant ropes ("12MINE", "FLEXMINE", "FLEXPACK MINING"). With fixed guides, the use of non-rotation resistant ropes is also possible ("6MINE", "7MINE", "7MINE HD", "8MINE").</li> <li>2) For shallow shafts up to 600 m (1968 ft), non-rotation resistant ropes ("6MINE", "7MINE", "7MINE HD", "8MINE") as well as rotation resistant ropes ("12MINE", "FLEXMINE", "FLEXPACK MINING") can be used.</li> </ol>	<ol style="list-style-type: none"> <li>1) With increasing shaft depth, ropes with less rope elongation are recommended (rotation resistant or non-rotation resistant steel core ropes and compound core ropes).</li> </ol>
Multi-layer drum hoist		
		
1. Rope property "Wear Resistance"	2. Rope property "Torque/Twist"	3. Rope property "Elongation"
<p>How wear resistant a rope has to be depends on the system parameters (tread pressure, hoisting speed, etc.)</p> <p>Wear resistance can be maximized by opting for:</p> <ol style="list-style-type: none"> <li>1) bigger outer wires</li> <li>2) compacted strands</li> <li>3) lang lay rope</li> <li>4) big overall outer rope surface</li> <li>5) higher wire grade (ideally not higher than 1960)</li> </ol> <p>ATTENTION: The right compromise between wear resistance and bending fatigue performance needs to be worked out.</p> <p>Note: The strand design of each rope can be customized.</p>	<ol style="list-style-type: none"> <li>1) Shafts deeper than 600 m (1968 ft) with wooden or rope guides (might) require rotation resistant ropes ("12MINE", "FLEXMINE"). With fixed guides, the use of non-rotation resistant ropes is also possible ("7MINE", "7MINE HD", "8MINE").</li> <li>2) For shallow shafts up to 600 m (1968 ft), non-rotation resistant ropes ("7MINE", "7MINE HD", "8MINE") as well as rotation resistant ropes ("12MINE", "FLEXMINE") can be used.</li> </ol>	<ol style="list-style-type: none"> <li>1) With increasing shaft depth, ropes with less rope elongation are recommended (rotation resistant or non-rotation resistant steel core ropes and compound core ropes).</li> </ol>

While abrasive wear can take place between the rope and the sheave and between the rope and the drum, the greatest cause of abrasion is often "rope interference" on the drum.

## Friction hoist

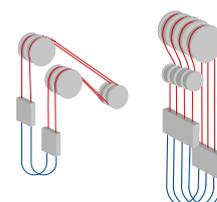

Friction hoist

1. Rope property "High bending fatigue performance"	2. Rope property "Torque/Twist"	3. Rope property "Elongation"
<p>The bending fatigue of a rope can be maximized by opting for:</p> <ol style="list-style-type: none"> <li>1) relatively small wires</li> <li>2) lang lay rope</li> <li>3) parallel lay strands</li> <li>4) low tensile grade wires</li> <li>5) proper lubrication</li> </ol> <p>Note: The strand design of each rope can be customized.</p>	<ol style="list-style-type: none"> <li>1) For shafts up to 1000 m (3280 ft), non-rotation resistant ("6MINE", "7MINE", "7MINE HD", 8MINE) and rotation resistant ropes ("12MINE", "FLEXMINE", "FLEXPACK MINING") can be used.</li> <li>2) For shafts deeper than 1000 m (3280 ft), only rotation resistant ropes ("12MINE", "FLEXMINE", "FLEXPACK MINING") should be used to reduce the risk of premature torsional fatigue of wires (the static load range of the system is to be considered).</li> </ol> <p>Note: Left hand and right hand ropes shall be used in pairs.</p>	<ol style="list-style-type: none"> <li>1) With increasing shaft depth (&gt;1000 m / &gt;3280 ft), it is recommended to use steel core ropes due to significantly less rope elongation (e.g. "12MINE", "FLEXMINE", "FLEXPACK MINING")</li> <li>2) With an increasing number of hoist ropes, it is recommended to consider steel core ropes, regardless of the shaft depth.</li> </ol>

## Balance ropes

The Koepe friction winder system necessitates the use of balance ropes, also called tail ropes, to reduce the requirement for frictional force at the Koepe drum. The balance rope weight is normally designed to be equal to the weight of the head ropes; however, balance ropes slightly heavier than the head ropes can be advantageous during the ascent of the skip/cage. There is no necessity to have the same number of balance ropes as hoist ropes. It is advantageous to operate with as few balance ropes as possible.

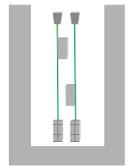

The following table shows important rope properties (besides breaking force, rope weight, rope diameter) to be considered when choosing the ideal balance rope.

1. Rope property "High flexibility and bending fatigue performance"	2. Rope property "Rotation resistance"	3. Rope property "Finish/Corrosion protection"
<ol style="list-style-type: none"> <li>1) Balance ropes are typically hanging freely underneath the skips/cages and form a natural loop. Taking into consideration the distance between the two anchor points of the rope ends, the rope must be flexible enough in order not to form a pear-shaped loop. Minimum distance values can be found on page 70 in this catalog.</li> <li>2) We recommend the use of our "IPERFLEX" ropes with a min. distance between the anchor points of 45 times the rope diameter.</li> </ol>	<ol style="list-style-type: none"> <li>1) Use of rotation resistant ropes with freely operating swivels on each end of the rope (round strand ropes).</li> </ol>	<ol style="list-style-type: none"> <li>1) Very often shaft bottoms are wet and corrosive. Therefore, a proper corrosion protection must be applied.</li> </ol> <p>Wire finish:</p> <ol style="list-style-type: none"> <li>a) galvanized class B</li> <li>b) galvanized class A</li> <li>c) ZnAl coating</li> </ol>

## Guide ropes

We recommend the use of half-locked coil ropes as guide ropes. Our "FLEXGUIDE HLC" has been supplied successfully to the mining industry for many years and is available in various diameters, with different tensile grades and with different coatings (corrosion protection). Alternatively and upon request, we can also supply a full-locked coil rope, i.e., "FLEXGUIDE FLC".

The following table shows important rope properties (besides breaking force, rope weight, rope diameter, finish, lubricant) to be considered when choosing the ideal guide rope.

1. Rope property "Wear resistance"	2. Rope property "Finish/Corrosion protection"
<p>1) Regardless of the rope diameter, we optimize the wear resistance of the rope by choosing the optimal wire sizes.</p> <p>2) The tensile grade of the wires also has an impact on the wear resistance. Taking into consideration the required breaking load, we find the right tensile grade for your guide ropes.</p>	<p>1) Very often shafts are wet and corrosive. Therefore, a proper corrosion protection must be applied.</p> <p>Wire finish:</p> <p>a) galvanized</p> <p>b) ZnAl coating</p>

The ideal rope diameter and required rope breaking force depend upon local regulations for the factor of safety and the tensioning required. The rope safety factor for guide ropes in most countries is 5:1 at the point in the rope with the greatest tension. The minimum load applied to achieve the adequate rope tension is 3000 kg (6614 lbs) plus 500 kg/100 m (1102 lbs/328 ft) of rope length according to the British Deep Mined Coal Industry Advisory Committee 08/2004. Some regulations provide for higher rope loads, e.g., 10 kN/100 m (2248 lbs/328 ft) of rope length for a suspended rope length of up to 1000 m (3280 ft) and approx. 8 kN/100 m (1798 lbs/328 ft) of rope length for a suspended rope length of over 1000 m (3280 ft) (German mining standard TAS 6). In order to minimize harmonic oscillation of the ropes, the tension in the ropes should vary slightly (plus/minus 10% of the average tension applied).

 Always refer to your local regulations for the minimum rope safety factor and the minimum rope tension required.

Teufelberger-Redaelli can also advise you on available attachment and tensioning systems ([wirerope@teufelberger.com](mailto:wirerope@teufelberger.com)).

## Shaft sinking ropes

### 1. Stage ropes

Shaft sinking projects require stage (winch) ropes for raising and lowering the working stage (Galloway).

The following table shows important rope properties (besides breaking force, rope weight, rope diameter, finish, lubricant, radial stability) to be considered when choosing the ideal stage rope.

1. Rope property "Rotation resistance"	2. Rope property "Wear resistance"
<p>1) These slow moving ropes are often connected to the stage by combining an open spelter socket, a chaseblock and a swivel. Therefore, the stage ropes need to be rotation resistant ("FLEXMINE" or "FLEXPACK MINING").</p>	<p>1) Stage ropes are wound onto a winch in several rope layers and with a relatively small D/d ratio. Therefore, it is necessary that these ropes are resistant to wear and crushing.</p> <p>2) Additionally, stage ropes are often used as guide ropes for the kibles during the hoisting operation. This also requires some wear resistance.</p> <p>We recommend using compacted rotation resistant ropes like our "FLEXMINE 440", "FLEXMINE 460" or "FLEXPACK MINING".</p>

 In addition to our FLEXMINE and FLEXPACK MINING ropes, we have special rotation resistant ropes available with improved breaking force to weight ratios. These ropes can be offered for special projects when a rope with superior performance values is needed and the cost of the rope is of secondary importance.

### Suspension ropes for shaft boring roadheaders (SBR)

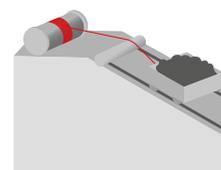

The FLEXMINE and FLEXPACK MINING ropes as well as other special high performance ropes (available upon request) are also ideal for the suspension of a shaft boring roadheader (SBR). These ropes can be used with small D/d ratios and in multi-fall configurations.

## 2. Kibble ropes

Kibble ropes must be rotation resistant to prevent excessive spin of the kibble or bucket in the shaft. Especially when the kibble reaches the shaft bottom, it ceases to be guided. When sinking deep shafts it could be beneficial to use two sets of kibble ropes. A shorter rope at the beginning which allows more adequate maintenance and reduces the risk of rope slackness in the dead turns with the consequential risk of rope distortion and premature rope failure, and a second longer one for the second phase of the sinking. We recommend for this application our proven FLEXMINE ropes with compacted strands.

## Incline (Haulage) ropes

Incline ropes (also called slope hoist or haulage ropes) are used for both the transport of men and the supply of materials.

The following table shows important rope properties (besides breaking force, rope weight, rope diameter, finish, lubricant, radial stability) to be considered when choosing the ideal haulage rope.

1. Rope property "Wear resistance"
1) Wear resistance is the most important rope property since the ropes are used on multi-layer drums; very often they touch the ground and are exposed to dirt.
2) The rope needs to be robust since it can be easily damaged by falling objects or when run over by vehicles like forklifts.
Wear resistance can be maximized by opting for:
1) bigger outer wires
2) compacted strands
3) lang lay rope
4) big overall outer rope surface
5) higher wire grade (ideally not higher than 1960)
We recommend to use our "7MINE" or "7MINE HD" with 19S outer strands.

## SPECIFIC WIRE ROPE TOPICS

### Rope torque

A load applied to a rope causes the rope to rotate and torque is built up if the wire rope end is prevented from twisting. The torque generated under load is usually directly related to the applied load by a constant torque factor "c1". Torque in a rope increases with the rope diameter. Non-rotation resistant ropes must be operated with both ends restrained from rotating; otherwise, the rope will unlay and become unstable. Rotation resistant ropes are designed to adjust to this torque and reach a balance so that this type of rope can be used with ends free to rotate.

The torque generated when loading a rope can be estimated from the following formula.

$$\text{Generated torque } T = c1 \cdot d \cdot S$$

T = torque [Nm]

c1 = torque factor [-]\*

d = nominal rope diameter [mm]

S = rope load [kN]

#### Example

Rope: FLEXMINE 460 RHLL

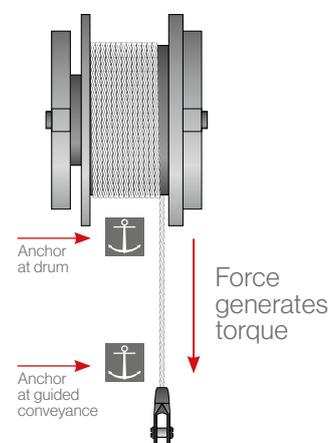

Nom. diameter: 45 mm

$$T = 0.03 \times 45 \times 349 = 471 \text{ Nm}$$

c1: 0.03

S: 20% of the MBF (1746 kN x 20% = 349 kN)

\*c1 values can be found on page 56

#### Teufelberger-Redaelli recommendation

Should you experience problems with rope torque (e.g., skips/cages get twisted excessively by the currently used rope or the wooden, steel or rope guides show uneven wear or the skip/cage guide shoes show uneven wear or the rope turns during a torque release violently and more than 15 to 20 times, etc.) it might be better to choose a rope with a lower torque value.

## Wire rope elongation

### Permanent elongation of a rope (non-elastic)

Any new rope elongates elastically during the first commencement of loading and, in addition, a permanent elongation occurs which will become evident after releasing the load. The permanent elongation is caused by the various components “bedding down” with a corresponding reduction in overall rope diameter. The amount of reduction in overall diameter mainly depends on the type and construction of rope and the range of loads. Most of the permanent elongation occurs early in the life of a running rope, although slight permanent elongation will occur throughout the life of the rope. Fiber core ropes show significantly more permanent elongation in comparison to ropes with a steel core. Bending cycles also influence the amount of elongation.

The initial permanent elongation of a rope cannot be accurately determined by calculation. Reasonable values in % of rope length are shown in the table below.

System parameters	Fiber core rope	Stranded steel core rope	Locked coil ropes
Factor of safety of about 5:1	0.50%	0.25%	0.10%
Factor of safety of about 4:1	0.65%	0.35%	0.15%
Under certain circumstances, rope elongation can be significantly higher (very low safety factor, many bends, deflection sheaves, etc.)	1.00% to 2.00%	up to 1.00 %	

Please contact us for more precise figures based on your system parameters and requirements ([wirerope@teufelberger.com](mailto:wirerope@teufelberger.com)).

### Temporary elongation of a rope until its yield point (elastic)

The temporary (elastic) elongation of a rope can be calculated with reasonable accuracy using the formula below.

$$\text{Temporary elongation in [m]} \Delta L = \frac{F \times L}{E \times A} \text{ where } A = C \times d^2$$

F = load applied [kN]

L = length of rope [m]

A = nominal metallic cross-sectional area of rope [mm<sup>2</sup>]

C = nominal metallic cross-sectional area factor

d = nominal rope diameter [mm]

E = modulus of elasticity of rope [GPa]

 Due to dynamic effects, the actual temporary rope elongation can be twice as high as the calculated value.

The table below gives approximate values for the metallic area and modulus of elasticity for ropes of various constructions.

Rope	Nominal metallic cross-sectional area factor (C)	Modulus of elasticity (E) [GPa] *)
RED1T	0.40	115
PACK1T	0.45	120
RED1 (P)	0.48	120
PACK1 (P)	0.54	120
6MINE	0.50	115
7MINE	0.50	115
7MINE HD	0.54	115
8MINE	0.49	115
12MINE 400(P)	0.46	105
12MINE 440(P)	0.51	120
12MINE 460(P)	0.53	125
FLEXMINE 400(P)	0.48	105
FLEXMINE 440(P)	0.52	115
FLEXMINE 460(P)	0.56	125
FLEXPACK MINING (P) with 15 outer strands	0.60	130
FLEXPACK MINING (P) with 18 outer strands	0.57	125
IPERFLEX	0.48	105
IPERFLEX L	0.45	100
IPERFLEX H	0.52	110
FLEXGUIDE HLC	n/a	125 - 150

\*) Theoretical values according to ISO tolerance  $\pm 10$  GPa

## Thermal expansion and contraction

Steel wire ropes increase in length with rising temperatures and decrease in length with falling temperatures.

The coefficient of linear expansion ( $\alpha$ ) of a steel wire rope is  $0.0000125 = (12.5 \times 10^{-6})$  per °C

$$\text{Change in length } \Delta L \text{ [m]} = \alpha \times L \times \Delta t$$

L = original length of rope [m]

$\Delta t$  = temperature change [°C]

Total elongation = permanent elongation + temporary elongation + thermal expansion (contraction)

### **Teufelberger-Redaelli recommendation**

*Should you experience problems with rope elongation during the loading/unloading of the skip, a rope with a higher modulus of elasticity could be considered. Ropes with reduced elongation properties can help reduce the amount of maintenance needed when the ropes are used as hoist ropes on multi-rope friction winders (e.g., no or less shortening of ropes, less re-tensioning of ropes, longer friction liner service life, etc.). Fiber core ropes can be pre-stretched upon special request and at an extra cost.*

Note: Pre-stretching is carried out during the closing process of the rope. Applied pre-stretching loads can be adjusted to the rope requirements.

**SAFETY:** A long non-elastic elongation and energy absorption section is essential from a safety point of view, since it implies that a rope will not break suddenly and unexpectedly, but any damage can be clearly detected and identified by a competent person during a "warning period".

## Tread pressure

Ropes are subject to radial pressure when they make contact with the sheave and the drum groove surface. This pressure distorts the rope's structure and affects the rate of wear of the sheave and the drum grooves. On a multi-layer drum winder, the tread pressure directly correlates with the amount of plastic deformation and wear in the turn cross-overs, especially in the first rope layer caused by the second rope layer (Note: A high tread pressure is only one factor for cross-over wear and plastic deformation). The actual pressure applied is a function of the rope tension (T), the rope diameter (d) and the sheave or drum diameter (D).

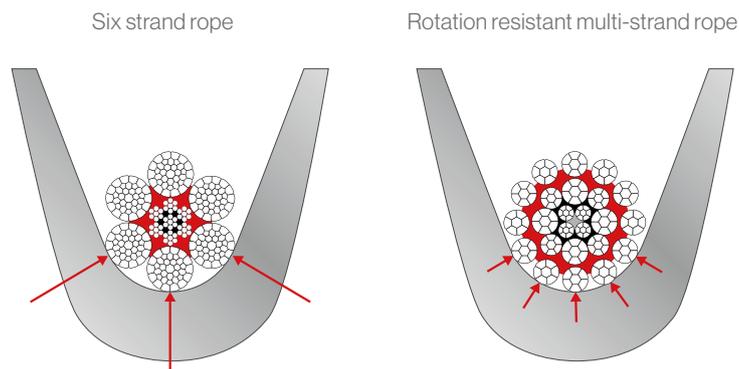

$$\text{Tread pressure in [N/mm}^2\text{]} \quad p = \frac{2 \times T}{D \times d}$$

p = tread pressure [N/mm<sup>2</sup> = MPa]  
T = rope tension [N]

D = diameter of sheave or drum [mm]  
d = nominal diameter of rope [mm]

The value calculated in this way is always lower than the real pressure, because there are relatively few contact points. These contact points and the total surface contact area depend on the rope type used.

As an example, the picture below shows a 6-strand rope and a rotation resistant multi-strand rope with compacted outer strands.

The actual pressure should be lower than the maximum value to avoid damaging the strands due to localized excess pressure (especially in multi-layer drum winder systems).

### Teufelberger-Redaelli recommendation

#### Drum winder

It is recommended to keep the tread pressure (p) below 3.5 N/mm<sup>2</sup> (510 psi), especially for multi-layer drum winder hoists. High values lead to a plastic deformation of the crown wires and eventually to split wires and premature wire breaks. One can then only try to avoid a short rope service life by increased maintenance efforts (e.g., more frequent drum end cuts, etc.).

#### Friction winder

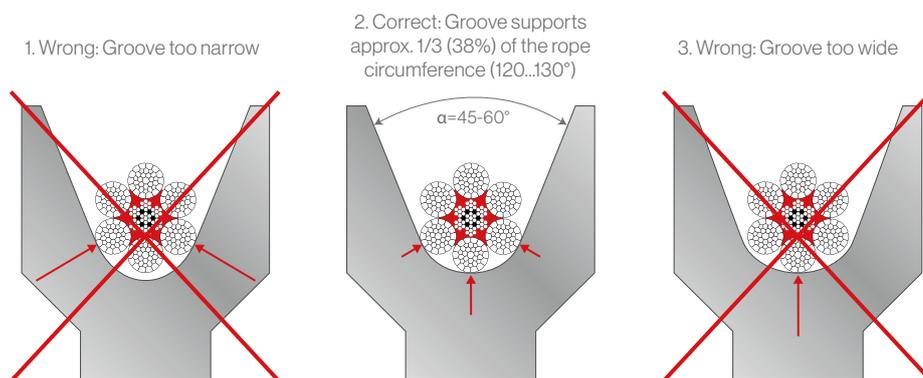

The tread pressure (p) should not exceed 1.72 N/mm<sup>2</sup> (250 psi) for stranded ropes and 2.75 N/mm<sup>2</sup> (400psi) for locked coil ropes. For stranded ropes for cage hoists, the value should not exceed 2.0 N/mm<sup>2</sup> (290psi), especially when considering occasional heavy payloads. If tread pressures are higher, the friction liner's service life will be negatively affected.

## Sheave grooves

Excessive lateral deviation on the sheave may lead to serious damage to the wire rope. The correct dimensioning of the groove is therefore essential for the rope's service life. Never use a sheave with grooves whose corresponding diameter is smaller than the actual diameter of the wire rope.

Always ensure that:

- ✓ the diameter of the groove is larger than the actual diameter of the rope.
- ✓ the groove is not worn (no indentations)
- ✓ the groove allows slight lateral deformation of the rope.

The correct scaling of the grooves must be as follows:

Minimum diameter of new groove:  $\varnothing_{\min} = 1.05 \times d$

Maximum diameter of new groove:  $\varnothing_{\max} = 1.10 \times d$

$d =$  nominal diameter of rope [mm]

Recommended diameter of new groove (drum winder):  $1.10 \times d$  (rotation and non-rotation resistant ropes).

Recommended diameter of new groove (friction winder):  $1.07 \times d$  (non-rotation resistant ropes)

Recommended diameter of new groove (friction winder):  $1.10 \times d$  (rotation resistant ropes)

The recommended groove diameters and the angle Alpha apply also to synthetic groove liners (e.g., Polyurethane liners).

Sheaves should be made of a material that is sufficiently hard to avoid rapid wear and indentations in service. Materials with hardness values of around 240 – 300 Brinell should show good results in most cases. If the pressures are too high for the sheave or drum material, the sheave or drum diameter could be increased which would also improve the service life of the rope. If this is not possible, using a rope with a bigger overall outer surface could be contemplated.

For high speed winding, the head sheaves should be 100 – 120 times the diameter of the rope. See also South African Standard SABS 0294 for further information and guidance.

### **Teufelberger-Redaelli recommendation**

Always check the actual groove diameter and check for the existence of indentations before installing a new rope. Should the actual groove diameter be too small and/or should any indentations be sharp-edged and/or relatively deep, the groove needs to be re-machined. In some cases, it is possible to customize the new rope so it fits the existing groove conditions.

## Drum grooves

The grooves on the rope drum must be suitable to accommodate the rope diameter. The groove diameter should never be smaller than the actual rope diameter:

$d =$  nominal rope diameter

$D =$  actual rope diameter

$p =$  groove pitch

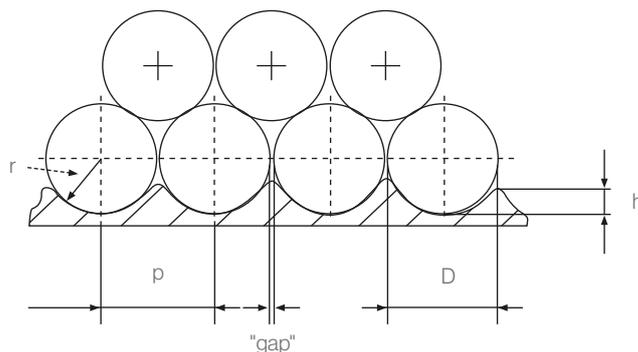

$p = d + 5.5\%$  to  $7\%$  ("gap" must be maintained at all times)

$h = 0.3 \times d$

$r =$  groove radius

Min. groove diameter  $= d + 5.5\%$

Ideal groove diameter  $= d + 7.5\%$

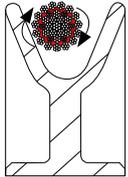

**Teufelberger-Redaelli recommendation**

Always check the actual groove diameter and check for the existence of indentations before installing a new rope. Should the actual groove diameter be too small and/or should any indentations be sharp-edged and/or relatively deep, the groove needs to be re-machined. In some cases, it is possible to customize the new rope so it fits the existing groove conditions. For single-layer drum winders, it is best to use a spiral grooved drum.

**Fleet angle**

The fleet angle is defined as the largest angle of the rope between the first sheave and the drum flange, relative to the centerline of the drum.

Whenever a rope passes a sheave with a fleet angle, a rotation is induced in the rope which leads to either a shortening or lengthening of its lay length. This mainly occurs when the distance between the drum and the sheave is too short. The amount of twist induced in a rope increases with an increasing fleet angle.

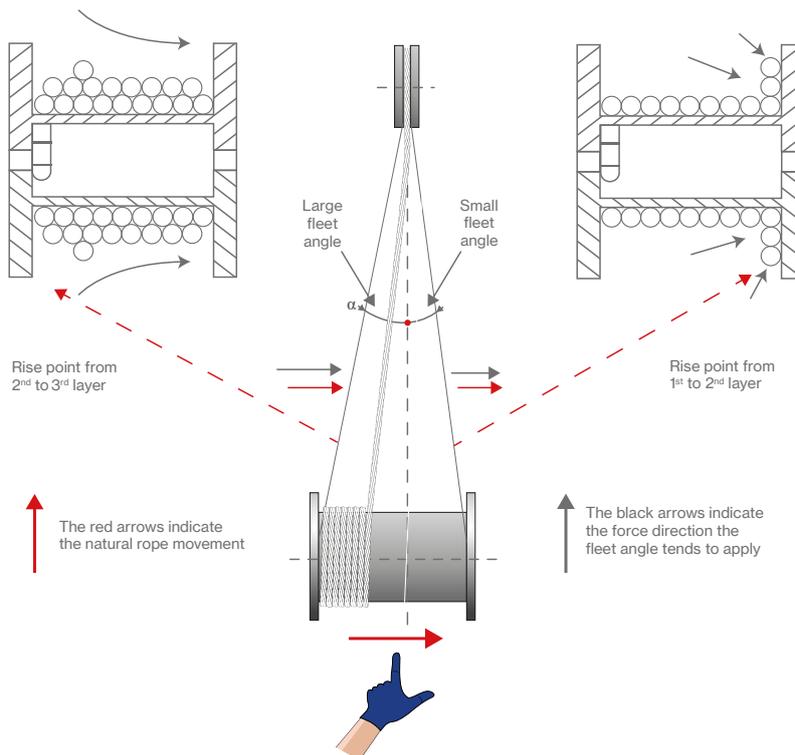

Fleet angles for grooved drums		
	Recommended fleet angle	Max. fleet angle
Non-rotation resistant ropes	0.5° - 1.5°	2°
Rotation resistant ropes	0.5° - 1.5°	2°
Full and half locked coil ropes	0.5° - 1.2°	1.5°

Note: For plain drums, it is recommended to limit the maximum fleet angle to 1.5° for non-rotation resistant ropes and to 1.2° for rotation resistant ropes including half and full locked coil ropes

⚠ The indicated maximum fleet angles for ropes should never be exceeded. Friction winders should ideally have no fleet angles. Plastic coated ropes are less sensitive to fleet angles.

Why is a correct fleet angle important?
Excessive fleet angles can lead to distortion of the steel wire rope.
Excessive fleet angles can result in abrasion between the rope and the sheave groove flange.
Helps to ensure correct spooling
<ul style="list-style-type: none"> <li>A fleet angle that is too small, i.e., less than 0.5°, can cause the rope to pile up at the drum flange. Eventually, the piled up rope will roll away from the flange and undesirable shock loads and unsafe operating conditions are the consequence.</li> <li>An excessive fleet angle will force the rope to rise prematurely and can create gaps between the wraps of the rope close to the flanges.</li> </ul>

The rope in the second layer is forced to rise once it reaches the left hand flange. At this point, the force of the natural tendency of the left hand lay rope and the force direction of the large fleet angle are oriented towards the right hand flange. The result is that the rope will most likely want to skip a wrap or two as shown on the left of the sketch. This is devastating in case another layer is to be coiled on top (top layer would cut into the layer below).

On the bottom layer, the rope is controlled by the drum grooves and moves away from the left hand flange (connection point). Once it has arrived at the right hand flange, the rope is forced up to the second layer. Now it is balancing on top of the wrap below it, with the force of the natural tendency of the left hand lay rope and the force direction of the small fleet angle oriented towards the right hand flange. This makes the rope reluctant to leave the flange, and the wraps tend to "pile up" as shown on the right side of the sketch. The result is a very hard crossover leading to prematurely broken wires.

In this scenario, the effects on a left hand lay rope with a very large fleet angle on the left hand side and a very small fleet angle on the right hand side are considered. There are three layers of rope on the drum, with the rope being connected on the left hand flange. Based on the Hand Rule, we know that the rope wants to move naturally towards the right.

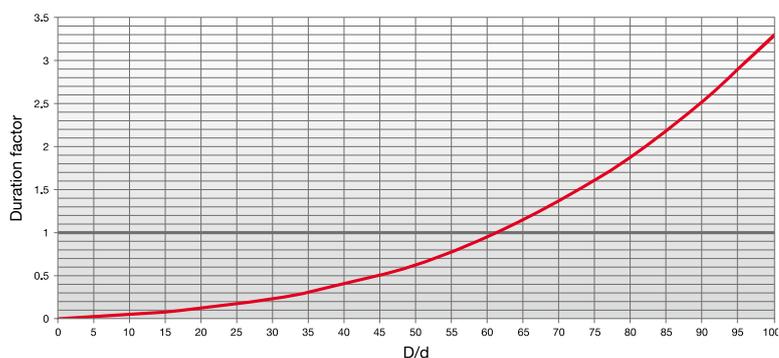

⚠ An indication of an incorrect fleet angle is rapid wear of only one of the flanges of a sheave and/or an uneven buildup of rope lubricant on the flanges.

## Bending fatigue

When a rope is bent over a sheave (drum), its components (wires) re-align themselves relatively to each other to equalize the stress throughout the cross-sectional area of the rope. Equalization can only be partially achieved and the outer wires experience an increased stress level. The increased stress leads to a reduced fatigue life which itself is an inverse function of the sheave (drum) diameter. The smaller the sheave (drum) to rope diameter the greater the bending stress and the higher the reduced fatigue life. To accurately calculate the additional stress imposed upon a rope due to bending, one must factor in the rope construction, internal lubrication, hoisting speed, and sheave groove geometry, and such calculation is therefore very difficult.

⚠ A change in direction of a rope of 15° or more is considered a complete bend. When bent over a sheave, wires are subject to alternating bending stresses which eventually lead to fatigue breaks with a characteristic square-ended fracture.

Predicting the service life of a rope (expressed as an absolute number of work cycles) without experimental data obtained under conditions similar to the actual operating conditions is difficult, and any prediction is subject to a significant degree of disparity in the results obtained.

The graph shows the relative service life of a rope with various D/d ratios. The reference duration (equal to 1) was obtained by testing with D/d = 62. Different D/d ratios decrease or increase the rope service life according to a duration factor as shown in the graph. It can be seen that with an increasing D/d ratio the expected rope service life increases exponentially.

The graph shows that the bending fatigue performance of a rope also depends on the load applied. With an increasing rope safety factor (= decreasing nominal load), the bending fatigue performance of a rope increases as can be seen in the graph. The reference duration (equal to 1) was obtained by carrying out testing with a safety coefficient of 5.

### Teufelberger-Redaelli recommendation

A practical way to predict the rope service life of a new rope construction is to consider the average rope service life of the last three rope constructions used in combination with the rope service life achieved with the new rope under similar conditions.

## Minimum D/d ratios

The tables below show recommended minimum D/d ratios for various rope constructions in combination with different applications. For smaller D/d ratios, please contact us (wirerope@teufelberger.com).

Rope	Min. D/d at slow speeds (≤ 1 m/s, 197 ft/min) (e.g., winches, rope installations, doubling down sheaves)
RED1T, PACK1T, RED1, PACK1	35*
6MINE, 7MINE, 7MINE HD, 8MINE	35*
12MINE 400(P), 12MINE440(P), 12MINE 460(P)	35*
FLEXMINE 400(P), FLEXMINE 440(P), FLEXMINE 460(P)	35*
FLEXPACK MINING(P)	35*
IPERFLEX, IPERFLEX L, IPERFLEX H	35*
EXTRAFLEX EVO	45*
FLEXGUIDE HLC, FLEXGUIDE FLC	45*

\*With increasing speed, the D/d ratio has to increase too.

Note: The South African Standard SABS 0294 specifies that the ratio shall not be less than  $40 + (4 \cdot v)$ , where v is the rope speed in m/s, but must not exceed 140.

Rope	Min. anchor point distance for balance ropes
12MINE 400, 12MINE 440, 12MINE 460	60 * d
FLEXMINE 400, FLEXMINE 440, FLEXMINE 460	45 * d
FLEXPACK MINING	45 * d
IPERFLEX, IPERFLEX L, IPERFLEX H	45 * d

⚠ The recommended D/d ratios refer to complete bends, i.e., a change in direction of a rope of 15° or more.

⚠ In any case, local regulations and standards have to be observed and may overrule the indicated minimum D/d ratios or may lead to a derating of a rope since a certain amount of bending stress has to be additionally considered for the rope safety factor calculation.

## Reverse bend

When two sheaves are used in a system, leading to a reverse bend situation for the rope, it is important to have a minimum distance between the two sheaves so that the wires in the rope have enough time to change position and no severe fatigue occurs (e.g., tower-mounted friction winder with deflection sheave). It is recommended that the length of the rope from the point of departure from one sheave to the point of contact on the other sheave should not be less than the length given by the two formulas below (the higher value of the two formulas applies):

$$R > v \times t = v \times 0.5$$

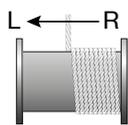

$$R > 200 \times d$$

R = rope length between sheaves [m]  
 v = maximum rope speed [m/s]  
 t = readjustment time of 0.5 seconds  
 d = nominal rope diameter [mm]

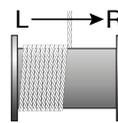

## Choosing the correct lay direction of the rope

Both the lay direction of the rope and the rotation direction of the winch/drum shall be taken into account as shown below:

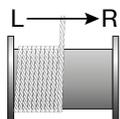

a) Right hand lay rope – underwind

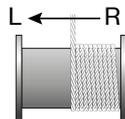

b) Left hand lay rope – underwind

c) Right hand lay rope – overwind

d) Left hand lay rope - overwind

The lay direction of a rope is crucial for the performance and the lifetime of a wire rope. The correct lay direction ensures that the rope in the bottom layer rotates in the direction which ensures that the rope construction closes during the upwinding. This ensures proper support of the second layer and increases the rope's service life. Furthermore, the correct lay direction can improve spooling when a fleet angle is slightly out of specification (too small).

In order to select the correct rope lay direction, each installation must be evaluated on its own and the following factors must be considered:

- Fleet angles
- Hoisting layout / configuration & position of drum hawse-hole (side on which the rope is attached to the drum)
- Hand Rule – determining the natural direction a rope will take

## Rope oscillation

Hoist ropes of multi-layer drum winders often experience severe oscillation between the headgear sheave and the hoist drum during some part of the hoisting cycle. Once a winder is installed and commissioned, this problem is difficult to overcome. Therefore, it must be addressed when the hoist manufacturer designs a new hoist (e.g., asymmetric Lebus shells, distance between head sheave and hoist, etc.). To keep the oscillation of the rope to a minimum, it must be ensured that the fundamental frequency of vibration of the rope and the impulse from the turn cross-overs on the drum do not coincide.

The formula for the vibration of a stretched string can be used to calculate with sufficient accuracy the fundamental frequency of vibration of a rope.

$$f = \frac{\sqrt{\frac{T}{m}}}{2 \times L}$$

$f$  = fundamental frequency [Hz]

$L$  = rope length from drum to head sheave [m]

$T$  = tension in rope [N]

$m$  = mass per unit of rope [kg/m]

## Multi-layer drum winder and required rope tension during rope installation and after drum end cuts

Multi-layer drum winder hoist ropes must be properly tensioned when initially installed or when reinstalled after a drum end cut to prevent loose dead wraps and the associated problems as long as possible. The minimum tension should be half the normal working tension, which can be applied by doubling down with a fully loaded conveyance or by using a capstan winch.

Experience has shown that applying a tension which is 60% - 80% of the normal working tension can increase both, the number of hoisting cycles between two drum end cuts and the overall rope service life.

⚠ If the dead wraps are not overlapped by a second rope layer, the load can be reduced to approx. 2% - 5% of the minimum breaking force of the rope and this load can be applied by doubling down with an empty conveyance or by using a capstan winch.

⚠ Drum end cuts are critical on most multi-layer hoists to achieve a long rope service life. The aim is to slip a new section of rope into the wear zone before too much rope damage occurs.

⚠ Newly installed Kibble ropes for a shaft sinking project should be tensioned with a load higher than achieved by doubling down with a fully loaded conveyance, since the amount of dead wraps is typically much higher compared to permanent hoist ropes (increased risk of rope slackness and consequential rope distortion and premature rope failure – broken wires).

## Various codes of practice for rope examination and rope discard

- ISO 4309:2010 (Note: Cranes - Wire ropes – Care and maintenance, inspection and discard)
- South Africa: SABS 0293 - Condition assessment of steel wire ropes on mine winders
- Canada: 2020 Occupational Health and Safety Act R.R.O. 1990, Reg. 854: Mines and Mining Plants, as amended up to O. Reg. 187/19 "MOL Green Book"
- USA: MSHA CFR 30 – Mineral Resources
- Australia: AS/NZS 4812:2003 – Non-destructive examination and discard criteria for wire ropes in mine winding systems
- UK: BS 6570:1986 Code of practice for the selection, care and maintenance of steel wire ropes
- Russia: RD 03-439-02 "Instruction for using steel wire ropes in mine shafts"

Please always refer to the latest version.

## DEFINITIONS AND VARIOUS TERMINOLOGIES

### Strand construction

N	Normal (symbol can be omitted)
S	Seale
W	Warrington
WS	Warrington-Seale
F	Filler

### Type of core

FC	Fiber core
SFC	Synthetic fiber core
IWRC	Independent wire rope core
EPIWRC	Independent wire rope core covered with a polymer
WSC	Wire strand core

### Lays and lay directions

RHRL	Right hand regular lay (sZ)
LHRL	Left hand regular lay (zS)
RHLL	Right hand lang lay (zZ)
LHLL	Left hand lang lay (sS)

K      Compacted strands

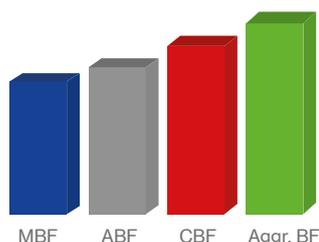

Regular lay ropes are also called ordinary lay ropes.

Rope grade	Approx. equivalent	Approx. hardness "Rockwell C"	Approx. hardness "Brinell"
1570	PS = Plow steel	45	405 / 425
1770	IPS = Improved plow steel	49	445 / 470
1960	EIPS = Extra improved plow steel	51	470 / 480
2160	EEIPS = Extra extra improved plow steel	52	480 / 500

**Rope grade:** Classification of the wire rope's tensile grade and basis for the rope's calculated breaking force.

**Note:** The nominal rope grade does not necessarily correspond to the nominal tensile grades of the wires used in a rope.

### Breaking force

- MBF..... Minimum breaking force  
[minimum force of whole rope below which the actual breaking force is not allowed to fall]
- ABF..... Actual breaking force  
[actual strength of whole rope obtained through a test to destruction].
- CBF..... Calculated breaking force  
[metallic area times nominal rope grade]
- Aggr.BF..... Aggregated breaking force  
[sum of the measured breaking forces of all individual wires taken from the rope after spinning].

**Fill factor (f):** The ratio between the sum of the nominal metallic cross section of the strand or rope and the circumscribed area of the strand or rope based on its nominal diameter ( $A_{met}/A_{nominal}$ )

**Torque factor (c1):** Determines the relationship between the wire rope tension and the corresponding torque, assuming that the wire rope end will be prevented from rotating.

**Layer cross-over:** The movement of the rope from one layer to the next layer on a multi-layer drum winder, also called "drum interlayer cross-over".

**Turn cross-over:** The movement of the rope from one wrap to the next wrap in the same rope layer, also called "interlayer cross-over".

**Plastic deformation:** Deformation of steel wires due to heavy side (or axial) pressure to rope.

**Seizing:** A wrapping or serving, particularly a wrapping or serving of wire, around a wire rope at its ends, to keep the rope from "flying apart".

**Hoisting cycle:** Defined as the movement of a hoist rope from the unloading position of the skip/cage to the loading position and back.

### Various conversion factors

25.4 mm	1 in
304.8 mm	1 ft
1 m	3.28084 ft

1 kgf	9.80665 N
1 kN	224.808943 lbf
1 metric ton	1.10231 American tons (short ton)
1 metric ton	9.80665
1 kg/m	0.671969 lbs/ft
1 lbs/ft	1.488163
1 m/s	196.8504 ft/min
1 km/h	0.277778 m/s
1 N/mm <sup>2</sup>	1 MPa

# HOW TO REQUEST AN UNDERGROUND MINING ROPE

## Inquiry Datasheet Mining

Internal number:	Sales Manager:	Date:		
<b>1.</b>	<b>Customer information</b>			
1.1.	Company name			
1.2.	Company address			
1.3.	Contact person			
1.4.	Phone			
1.5.	E-mail			
1.6.	Place and country of installation			
1.7.	Shaft name or no.:			
1.8.	Type of shaft	Service <input type="checkbox"/>	Production <input type="checkbox"/>	Other <input type="checkbox"/> (describe)

<b>2.</b>	<b>Wire rope information</b>						
2.1.	Application (type of rope)	Hoist <input type="checkbox"/>	Guide <input type="checkbox"/>	Balance <input type="checkbox"/>	Shaft sinking <input type="checkbox"/>	Other <input type="checkbox"/> (please describe)	
2.2.	Wire rope	First install. <input type="checkbox"/>		Replacement <input type="checkbox"/>			
2.3.	Relevant wire rope standard, e.g., EN12385, CSA G4 Canada, ...						
2.4.	Nominal rope diameter [mm, inch]						
2.5.	Rope construction currently in use, e.g., 6xK19S, 8xK26WS-IWRC, triangular strand 6x30, ...	Compacted <input type="checkbox"/>		Non-compacted <input type="checkbox"/>			
2.6.	Core	FC <input type="checkbox"/>		IWRC <input type="checkbox"/>			
2.7.	Lay type	Regular <input type="checkbox"/>		Lang's lay <input type="checkbox"/>			
2.8.	Lay direction	Right <input type="checkbox"/>		Left <input type="checkbox"/>			
2.9.	Nominal rope weight [kg/m or lbs/ft]						
2.10.	Length of rope [m or ft]						
2.11.	Number of ropes needed						
2.12.	Wire finish	Bright <input type="checkbox"/>		Galvanized class B <input type="checkbox"/>	Others (please describe)		
2.13.	Nominal tensile strength [N/mm <sup>2</sup> ]						
2.14.	Minimum breaking force [kN or lb]						
2.15.	Min. aggr breaking force [kN or lb]						
<b>3.</b>	<b>System information</b>						
3.1.	Shaft depth [m]						
3.2.	Type of hoist	Drum hoist		Tower-mounted friction hoist <input type="checkbox"/>			
		Single drum <input type="checkbox"/>		Ground-mounted friction hoist <input type="checkbox"/>			
		Double drum <input type="checkbox"/>		No. of hoist ropes			
		Blair double drum <input type="checkbox"/>					
		Type of grooving	Lebus <input type="checkbox"/>				
			Helical <input type="checkbox"/>				
	No. of rope layers						

3.3.	Guide system	Fixed guides <input type="checkbox"/>	Rope guides <input type="checkbox"/>	Wooden guides <input type="checkbox"/>
3.4.	Drum diameter [mm or ft]			
3.5.	Required minimum rope safety factor			
3.6.	Weight of skip incl. attachments [kg or lb]			
3.7.	Payload [kg or lb]			
3.8.	Max. rope speed [m/s or ft/min]			
3.9.	Max. suspended rope length [m or ft]			
3.10.	Current average rope life in cycles and years

# WE LEAVE NOTHING TO CHANCE

People's safety - and sometimes even their lives - depend on the reliability of steel wire ropes. For the selection of a high performance steel wire rope, reliable specifications such as breaking force, rotating characteristics, service life, spooling characteristics as well as discard criteria are key for multi- and single-layer spooling use. Each parameter has a direct impact on the total operating costs.

Therefore, we at Teufelberger-Redaelli consider all conceivable aspects like design, environment, hoist parameters, as well as specific applications right from the start when developing a rope. Using one-of-a-kind and state-of-the-art systems for testing and analyzing allows us to thoroughly examine every detail of the rope. This is how we develop premium high performance steel wire ropes excelling in each specific application.

- ✓ Precise planning: CAD
- ✓ Service life under scrutiny: bending fatigue testing machines
- ✓ Turning the inside out: the MRT-method (Magnetic Rope Testing)
- ✓ Precision with a big impact: electronic measuring equipment for efficiency testing
- ✓ Determining breaking forces and analyzing torsional behavior: tensile testing machines

## Rope end terminations subjected to endurance testing: dynamic fatigue tests and tensile testing machines

By means of dynamic fatigue tests and tensile testing machines, we analyze the influence of rope end terminations on the breaking forces of our high performance steel wire ropes. Our unique technical equipment allows us to carry out tests up to 3000 kN. Only suitable and correctly mounted rope end terminations make a rope complete. The information obtained ensures that the different rope types manufactured by Teufelberger-Redaelli work safely and reliably in combination with the right termination.

## Excelling through partnerships

Intensive partnerships with a sizable number of key users are clear examples of our focus on our customers' needs. Also, our long-standing cooperation with universities and research institutions ensures the lively exchange of ideas and proactive approach toward the development of new and existing products.

# SERVICES ALONG THE WAY - WE GLADLY SHARE OUR EXPERTISE

The quality of the right solution is not only driven by the technical features of the high performance wire rope itself, but also the services that come along with it. Teufelberger-Redaelli is committed to supporting you right from the beginning, when you are looking for the optimal solution, by providing calculations and technical advice to ensure that the rope meets the technical parameters and ideally complements your entire hoisting system.

Teufelberger-Redaelli's network of experts provides competent support close to you. We share our expertise during installation, but also when maintenance work is necessary.

**We are your competent service partner and will provide you with help and answers within 24 hours: +43 (0) 7242 615 388**

**WE ARE MORE THAN JUST ROPES – please consider us an extension of your own wire rope team. Therefore, do not hesitate to contact us any time for free-of-charge support and advice. [wireropes@teufelberger.com](mailto:wireropes@teufelberger.com)**

## Theoretical and hands-on training

Your everyday challenge is to ensure the smooth performance of your equipment at predictable costs. More than 230 years of experience in the manufacture, installation and inspection of ropes have made Teufelberger-Redaelli what it is today - the best in rope handling.

In a concise, yet comprehensive training, our experienced field engineers will share their expertise with you. Our training sessions, are vivid lessons with both theoretical and practical content. The skills you can develop in this training are, e.g.:

- Understanding different rope types and constructions so as to be able to make an informed and calculated decision when choosing the most suitable rope for a given application
- Profound knowledge about the proper installation of ropes
- Recognizing when a rope has to be discarded according to ISO 4309 and other acceptable standards
- Knowing how to store a rope appropriately
- Improving your rope handling experience through practical lessons
- Socketing training
- Key insights with regard to multi-layer spooling
- Troubleshooting according to your operational and maintenance needs

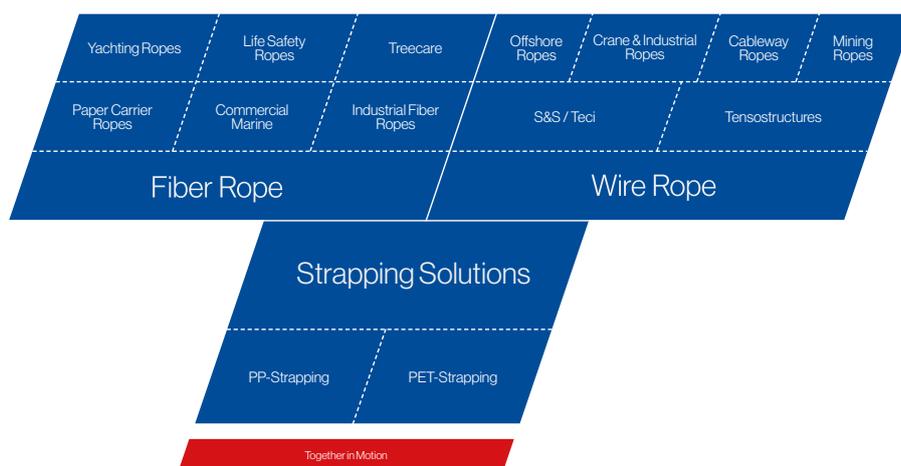

Become a certified rope specialist

# EXPERTISE FROM MORE THAN 230 YEARS OF EXPERIENCE

What started back in 1790 as a simple shop making hemp ropes has since evolved into a globally successful group of enterprises specializing in the development and production of fiber and steel wire ropes as well as strapping.

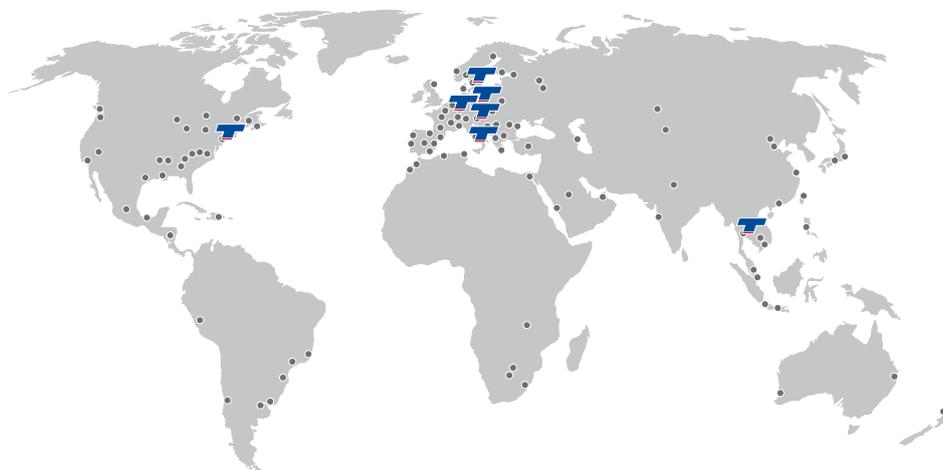

## Great diversity

TEUFELBERGER's products and services are destined for a wide variety of applications ranging from cranes and marine applications to packaging and through to personal protection. The continuity and stability of a family enterprise makes us a reliable partner who, competently and effectively, supports you in mastering your day-to-day challenges.

## Global presence and customer proximity

Manufacturing operations in various countries allow us to meet local quality and certification standards as well as customer requirements without difficulty. From our sites in Austria, the Czech Republic, the U.S., Italy, Sweden, and Thailand, and backed by a close-knit global network of distribution partners, we continue to satisfy the expectations of our customers.

## Innovative solutions through synergies

TEUFELBERGER is a leading specialist for fiber and steel wire ropes as well as strapping. The spectrum of technologies in TEUFELBERGER's portfolio generates various synergies between the extrusion of thermoplastics, the braiding of high performance fibers, and the processing of wires into ropes and strapping.

Especially fiber and steel wire products have brought about valuable synergies with regard to both application and manufacturing technologies, which have benefited our customers tremendously. This makes TEUFELBERGER your ideal partner right from the project planning phase.

5 % of TEUFELBERGER's employees are active in research and development and make sure that our customers have access to the latest innovative rope technologies. 10 % of the entire investment volume is committed to development and quality assurance.
