

# Air

Newly implemented protocols in your building aim to enhance air quality to support your health and well-being. You can breathe easy in your space knowing that air quality standards set for your building are supported by ventilation and filtration features, construction policies and cleaning protocols as well as material safety guidelines.

Pollution-source reduction, proper ventilation, air filtration, low chemical material selection and cleaning standards to minimize the spread of germs are some of the strategies your building team utilizes to achieve high air quality.
