

INTERNET BACKUP

The simple solution for a fail-safe Internet connection.

YOUR ADVANTAGES

- ✓ Continued Internet connection despite cable network outages
- ✓ Automatic configuration (plug & play)
- ✓ Automatic operation

Is your company dependent on a fail-safe Internet connection? Internet Backup is a simple and affordable solution for SMEs that want to be on the safe side with their Internet connection.

Fully automatic

Here's how Internet Backup works: In the event of a fault in the cable network, a connection is automatically established with the mobile network and the Internet session is continued with a 4G connection. The connection is maintained until the fault in the cable network has been corrected. The modem recognises this itself and automatically switches back to normal operation. The downtime lasts a maximum of one minute.

Operation: Plug & Play

Putting Internet Backup into operation is very simple. You receive a backup stick with a SIM card for Mobile Data 4G. The stick is inserted into the cable modem. When the modem is restarted, the Internet Backup automatically configures itself. You will then have access to the full range of functions.

1. Fault in the cable network

2. Downtime of 60 seconds

3. Mobile 4G connection

Price

CHF 10/month (excl. VAT)
Prices and offers subject to change.

Scope of application

- The backup stick can only be used with Hitron DHCP modems from UPC Business.
- Internet Backup can only be used at the main site if the cable connection at the modem location has failed.
- This option can only be used on a modem with a dynamic IP (DHCP).

Performance

The performance of the 4G backup connection depends on the signal strength and the current network load of the mobile network. This means that performance may vary (average: 25/10 Mbit/s, ideal case: 80/30 Mbit/s). There is no guarantee of the voice quality for VoIP telephony.
