

# BUSINESS SECURE WEB

Protect your business from cyberattacks.

## YOUR ADVANTAGES

- ✓ Effective protection against cyberattacks
- ✓ Simple activation and installation
- ✓ Protection for PCs and laptops being used from home, in the company network and on the go
- ✓ No impairment of the Internet speed
- ✓ Automatic updates
- ✓ Real-time reporting

Protecting the IT infrastructure against cyberattacks poses a growing challenge for companies. How can IT security be maximised, but with minimal effort? The solution: Business Secure Web.

Business Secure Web combines the security expertise of outstanding experts with continuously active cloud service. This automatic protection is the ideal supplement to your Business Internet subscription.

### Security on the DNS level

Cybercriminals use websites to steal confidential data (phishing), to spread and install malicious files (malware), and then to manipulate compromised computers (via command and control callbacks).

Business Secure Web knows which addresses are dangerous and automatically blocks Internet connections that could harm your company. Before the browser can load dangerous web content or download and install malicious files, the query is blocked and a warning is displayed. This cloud service operates as a first and very effective line of defence on the DNS level

and supplements existing classic security solutions such as firewalls, virus protection and VPN.

### Effective protection

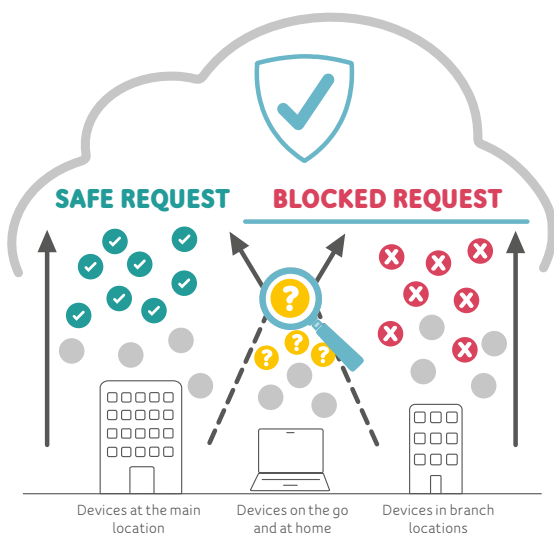

Business Secure Web protects all Windows PCs and Macs that have an Internet connection from UPC Business. Even laptops being used for working from home or on public WLAN networks benefit from the protection. This service does not affect the Internet speed.

### Simple activation

Business Secure Web is activated for you automatically in the background in the cloud at the touch of a button. You need no additional hardware. Manual software updates are not needed. The only prerequisite for using this service is an Internet connection from UPC Business.

### DOMAIN NAME SYSTEM (DNS)

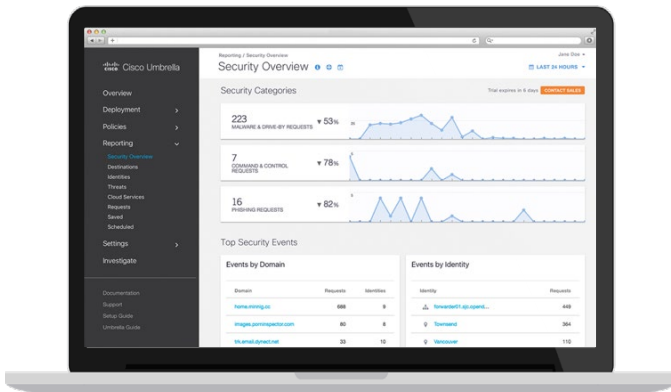

The Domain Name System is a fundamental component of the Internet which links a domain name with the associated IP address. When you click on a link or enter an URL in the browser (such as [www.upc.ch](http://www.upc.ch)), the DNS query initiates the process of connecting the respective device to the correct server.

## All threats monitored

Business Secure Web logs all security-relevant events in real time. Thanks to the reports on your dashboard, you are kept informed of the Internet activities at all your locations.

- Reporting in real time, full visibility of all security-related activities in your network (e.g. blocked attacks)
- Filtering by time period and threat categories (e.g. phishing)
- Export of reports possible
- Access to the dashboard via our [mybusiness](#) customer portal

## Outstanding partner

With Business Secure Web you are using the cloud services of Cisco Umbrella. The security expertise and continuous updates are provided by one of the largest teams of experts for recognising threats: the Cisco Talos Intelligence Group with more than 300 researchers worldwide.

## Prices

Basic package for up to 3 users: **CHF 10** per month  
Additional users: **CHF 3** per user and month

All prices quoted exclusive of VAT. Prices and offers subject to change.
