

DIAQUICK HCG COMBO CASSETTE

- Urine, serum or plasma
- Sensitivity 25 mIU/ml
- Limit 1,000,000mIU/ml
- Result in ≤5 minutes

Catalogue Number	Description	Pack Size
Z01405CE	DIAQUICK hCG Combo Cassette	30 Tests

Human chorionic gonadotropin (hCG) is secreted by the placenta shortly after fertilisation. In normal pregnancy hCG can be detected in serum, plasma and urine from as early as 7-10 days after conception. hCG levels continue to rise peaking at ~100,000-200,000 mIU/ml by 10-12 weeks.

The DIAQUICK hCG Combo cassette can be used with urine, serum or plasma samples. This easy to read lateral flow assay has a sensitivity of 25 mIU/ml and is standardised against the WHO 4th IS 75/589.

When using urine samples results can be read after 3 min, for serum or plasma tests should be read at 5 min.
